Air oxidation tests of iron-aluminum alloys containing 16 and 28 atom % Al, respectively, were conducted at 1300°C to determine the effect of alloy composition and section thickness on the time to breakdown of oxidation resistance. The oxidation rates of the 16% Al alloy were significantly higher than for 28% Al (Fe_3Al) alloys. The times over which the oxide scales remained protective correlated with the extent of aluminum depletion of the alloy matrix and were therefore a direct function of the initial aluminum content of the alloy, the section thickness, and the oxidation rate. The oxidation rate of the Fe_3Al alloys was significantly reduced by the addition of 0.1% Zr, which improved the adherence of the scale during thermal cycling to room temperature. However, the oxidation rates of the Fe_3Al alloys were higher at 1300°C than those reported for oxide-dispersion-strengthened (ODS) Fe-18%Cr-10%Al alloys containing Y_2O_3. Times to the onset of breakaway oxidation were similar for zirconium-containing Fe_3Al and the ODS alloys, the lower oxidation rate of the latter offsetting the higher initial aluminum of the former. Studies of the effects of chlorine (HCl) on the oxidation/sulfidation resistance of Fe_3Al-based alloys were conducted using test facilities at the National Physical Laboratory (NPL) in the United Kingdom. Alloys were exposed to a test gas composed of CO_2, H_2, H_2O, and H_2S plus 1000-5000 ppm HCl at 450 and 550°C for 1000 h. Weight gains were relatively low and were generally less than companion specimens of Fe-Cr-Al alloys.

6205 (ORNL/FMP–94/1, pp. 321-330) **Localized corrosion and stress corrosion cracking characteristics of low-aluminum-content iron-aluminum alloys.** Kim, J.G. (Univ. of Tennessee, Knoxville, TN (United States)); Buchanan, R.A. Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

The aqueous corrosion behavior of FAPY, a new low-Al-content Fe-Al alloy (Fe-16.1Al-5.4Cr-1.1Mo-0.11C-0.11Zr-0.06Y, at.%), was studied in various electrolytes and compared with reference materials. Corrosion rates for FAPY were much closer to that of 304L stainless steel than to the plain-carbon and low-alloy steels evaluated. Three-week crevice corrosion tests were performed in chloride-containing solutions on FAPY, and for comparison on 304L stainless steel. The FAPY alloy was less resistant to crevice corrosion than the 304L stainless steel. In the 3.5 wt.% NaCl solution, the FAPY alloy was subject to severe crevice corrosion. Slow-strain-rate corrosion tests were conducted at the freely-corroding open-circuit potential and at potentiostatically-controlled anodic and cathodic potentials to evaluate the environmental-embrittlement susceptibility. It was found that the FAPY alloy was susceptible to hydrogen embrittlement and anodic-dissolution stress corrosion cracking, but at the freely-corroding and hydrogen-producing-cathodic potentials, the ductilities were significantly higher than those for Fe_3Al-based iron aluminides.

6206 (ORNL/FMP–94/1, pp. 331-341) **Interactions between creep and corrosion in alloy 800.** Natesan, K. (Argonne National Lab., IL (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. DOE Contract W-31109-ENG-38. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Metallic components within or immediately adjacent to gasifiers, such as gas distributors, thermowells, transfer lines, and cyclones, are subjected to particularly severe conditions of temperature, pressure, and hostile multicomponent gas environments. In addition, metallic heat exchangers/waste-heat boilers that are resistant to sulfidation, corrosion, and erosion in low- and medium-Btu gas environments are essential components in large-scale gasification schemes, in both dry ash and slagging type gasifiers. Components, in general, must be resistant to corrosion, erosion, and high-temperature creep. Refractory linings are conventionally employed to mitigate corrosion and erosion, and in some cases, internal cooling has been considered to avoid the problems associated with the interaction of high-temperature creep and fatigue. Contrary to the design situation for vessels and piping, no guidance in the form of a code or standard exists for vessel internals and long-life external components, especially for service in corrosive-erosive environments at elevated temperatures. Designers currently rely on their stress-analysis techniques and rules and use their experience with petrochemical applications to incorporate the environmental effects in the design of components for coal conversion systems. Such an approach may lead to adequate design, but a substantial data base is needed on the mechanical properties of materials exposed to complex gas environments to provide a more viable basis for establishing long-term reliability of components. The purpose of the present work is to examine the high-temperature creep behavior of Alloy 800, a high-chromium alloy that is widely used in coal conversion systems, after exposure to oxygen and oxygen/sulfur mixed-gas environments. The data on the creep behavior of the alloy under various pretreatment and test-exposure conditions are used to establish performance enveloped for the alloy for service in fossil energy applications.

For a halide-activated pack cementation process, codeposition of Cr and Si into diffusion coatings on steel surfaces can be achieved by using two halide salts to jointly optimize the partial pressures of $CrCl_2(v)$ and $SiF_2(v)$. The selection of the second salt is the key point for this process. A SOLGASMIX program was used to calculate the equilibrium vapor pressures of different metal halide gas species for different activator salt combinations. Two salts with the same cation develop low partial pressures for $CrCl_2(v)$ and $SiF_2(v)$, which are not high enough to codeposit Cr and Si into a coating. Two salts with different cations produce a different result. Some combinations, such as NaCl and CaF_2, have high and comparable partial pressures of $CrCl_2(v)$ and $SiF_2(v)$. However, other combinations either have low partial pressures, or the partial pressures of $CrCl_2(v)$ and $SiF_2(v)$ are not of the same magnitude. The role of the partial pressure for the alkali metal is elucidated. Experimental verifications are consistent with the theoretical predictions, and

thus coated steels exhibit excellent corrosion resistance to cyclic oxidation and aqueous corrosion.

6208 (ORNL/FMP–94/1, pp. 355-363) **Development of a modified 310 stainless steel.** Swindeman, R.W. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Structural materials performance requirements were re-evaluated for use in emerging fossil energy applications. Concepts included low emission boilers, advanced steam cycle, and combined-cycle technologies. Both pressure-bearing and non-pressure-bearing applications were considered. The adequacies of martensitic and austenitic steels were examined, and comparisons of the potential of various alloy selections were undertaken. Both austenitic and martensitic steels were judged to have applicability for boilers operating at 600°C while fine-grained austenitic alloys were judged to be best for service to 650°C. For applications in the range 650 to 760°C, modified 310 stainless steels were judged to be good choices. Above 760°C, the alloys being considered for pressurized fluidized bed combustors (PFBCs) included oxidation-resistant stainless steels. For carbonizers and gasifiers operating below 900°C, cobalt-bearing alloys and modified 310 stainless steels were of interest. Iron-aluminide cladding was also considered, and experimental studies were begun to examine compatibility with pressure boundary materials. The data base for modified 310 stainless steels was expanded to 1038°C, and testing times ranged to beyond 10,000 h. The performance of weldments in modified 310 stainless steel was examined and found to be adequate to enable the use of the material at 871°C. Exploratory work on fatigue was undertaken. For service above 900°C, exploratory evaluations of cast high alloys (HP) and alloy 160 were begun. Creep, fatigue and crack growth testing was initiated on alloy 160. Interactions and collaboration with industry were maintained.

6209 (ORNL/FMP–94/1, pp. 365-375) **Investigation on the weldability of high temperature alloy tubing materials.** Lundin, C.D. (Univ. of Tennessee, Knoxville, TN (United States)); Qiao, C.Y.P. Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Gleeble hot ductility, Varestraint hot cracking and Finger hot cracking evaluations on thick wall commercial 310HCbN tubing material agree with and verify the weldability predictions based on the Varestraint testing results from thin wall 310HCbN materials. A good correlation was found between hot cracking and hot ductility testing results. Short term stress rupture testing of modified 800H, NF709, NF616 and transition joints between modified 800H and T91 was conducted. For welded modified 800H (with HD556 and Inconel 117 filler), the HAZ exhibits a lower rupture strength as compared to the base metal or filler metal. For welded NF709 (with 709 filler), the weld metal shows a slightly lower rupture strength compared to the HAZ and base metal. In general, the NF709 weldment (with NF709 filler) showed an equivalent or slightly lower rupture strength compared to the modified 800H weldments (with ether HD556 or Inconel 117 filler). A preliminary evaluation on iron aluminide clad stainless steel tubing was carried out. Arc spray, GTAW and GMAW techniques were utilized for preparing the clad coupons. Comparison of the characteristics of the interface in terms of the different fabrication techniques was addressed. Iron aluminide weld deposited clad on stainless steel, by fusion welding, provides for an excellent bond between the iron aluminide and stainless steel and shows relatively good operational ease.

6210 (ORNL/FMP–94/1, pp. 377-390) **Cr_2Nb-based alloy development.** Liu, C.T. (Oak Ridge National Lab., TN (United States)); Horton, J.A.; Carmichael, C.A. Oak Ridge National Lab., TN (United States). Aug 1994. DOE Contract AC05-84OR21400. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

This paper summarizes recent progress in developing Cr_2Nb/Cr(Nb) alloys for structural use in advanced fossil energy conversion systems. Alloy additions were added to control the microstructure and mechanical properties. Two beneficial elements have been identified among all alloying additions added to the alloys. One element is effective in refining the coarse eutectic structure and thus substantially improves the compressive strength and ductility of the alloys. The other element enhances oxidation resistance without sacrificing the ductility. The tensile properties are sensitive to cast defects, which can not be effectively reduced by HIPping at 1450-1580°C and/or directionally solidifying via a floating zone remelting method.

6211 (ORNL/FMP–94/1, pp. 391-400) **Alloying effects on the high-temperature oxidation resistance of Cr-Cr_2Nb.** Tortorelli, P.F. (Oak Ridge National Lab., TN (United States)); DeVan, J.H. Oak Ridge National Lab., TN (United States). Aug 1994. DOE Contract AC05-84OR21400. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Alloying effects on the high-temperature oxidation resistance of Cr-Cr_2Nb were examined on the basis of isothermal exposures to air at 950°C. Additions of either Re and Al or Fe, Ni, and Al had relatively little effect on weight gains relative to the Cr-6% Nb binary alloy. One alloying element that improved the mechanical behavior of Cr-Cr_2Nb alloys substantially increased the oxidation rates and spallation susceptibilities of Cr -6 and -12% Nb alloys. However, the addition of another element completely offset these deleterious effects. The presence of this latter element resulted in the best overall oxidation behavior (in terms of both weight gains and spallation tendencies) of all Cr-Cr_2Nb compositions. Its beneficial effect can be attributed to improvement in the oxidation resistance of the Cr-rich phase.

6212 (ORNL/FMP–94/1, pp. 401-412) **Fracture behavior of Cr_2Nb-based intermetallics.** Cook, J.A. (Univ. of Tennessee, Knoxville, TN (United States)); Liaw, P.K.; Liu, C.T. Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Microstructural evaluations of Laves-phase alloys based on Cr_2Nb were examined in order to determine phase relationships with heat treating temperatures up to 1580°C. At ambient temperatures, single-phase Cr_2Nb alloys are very hard and brittle due to the difficulty in generation and glide of dislocations because of the complicated crystal structure (C-15). The following results were revealed through examination of the Cr-Cr_2Nb two-phase region: (a) with increasing amounts of the soft chromium-rich phase, the hardness decreases; (b) the heat treatments studied provided the best dispersion of the chromium-rich phase in the Cr-6at.% Nb (CN-7) alloy; (c) an anneal of 3 days at 1100°C + 1 hour at 1580°C provided for the best dispersion of the Cr-rich phase and break-up of the Laves-type phase in the CN-7 alloy. Previous studies have shown that the introduction of a soft chromium phase has promising effects in improving the mechanical properties of brittle Cr_2Nb Laves-phase alloys.

6213 (UCRL-ID–112775, pp. 6.23-6.30) **Modeling superplastic materials.** Lesuer, D.R.; Syn, C.K.; Preuss, C.S.; Raboin, P.J. Lawrence Livermore National Lab., CA (United States). Mar 1993. In *Materials Science and Engineering.* 30p. Order Number DE94003018. Source: OSTI; NTIS; GPO Dep.

In this work, the authors have developed a model that accounts for grain growth during superplastic flow, and its subsequent influence on stress/strain/strain rate behavior. The studies are experimentally based and have involved two different types of superplastic materials: a quasi-single phase metal, Coronze 638, and a microduplex metal, ultrahigh-carbon steel. The kinetics have been studied of strain-enhanced grain growth in both materials as a function of strain, strain rate, and temperature. An equation for

the rate of grain growth has been developed that incorporates the influence of temperature. The model integrates grain growth laws derived from these studies, with two mechanism-based, rate-dependent constitutive laws to predict the stress/strain/strain rate behavior of materials during superplastic deformation. The material model has been added to the NIKE2D code through an enhancement of the Deformation Mechanism Model. The predictions of the model have been compared with data from several experiments. 11 refs., 10 figs., 2 tabs.

6214 (UCRL-ID–112775, pp. 6.7-6.9) **Casting process modeling.** Shapiro, A.B. Lawrence Livermore National Lab., CA (United States). Mar 1993. In *Materials Science and Engineering.* 30p. Order Number DE94003018. Source: OSTI; NTIS; GPO Dep.

In predicting the quality of a cast part, two important factors are (1) correct modeling of the fluid flow and heat transfer during the filling of a mold with a molten metal, and (2) the thermal-mechanic physics of solidification and cool-down. Determining the dynamics of the flow and the free surface shape during filling are essential in establishing the temperature gradients in the melt and in the mold. Correctly modeling the physics of volume change on solidification, shrinkage on cooling, and contact resistance across the part-mold interface directly affects the cooling rate and, ultimately, the final cast shape and stress state of the cast part. This year's efforts were focused on modeling fluid fill and on the physics of solidification. 3 refs., 2 figs.

6215 (VTT-PUB–131) **Computer-aided simulation of the heat treatment.** Arola, R. (Technical Research Centre of Finland, Espoo (Finland). Metallurgy Lab.); Martikainen, H.; Virta, J. Technical Research Centre of Finland, Espoo (Finland). 1993. 49p. Order Number DE95723867. Source: OSTI; NTIS.

Computer-aided simulation of the heat treatment of components and charges is examined. Existing programs for the simulation of heat treatment are reviewed. Test simulations including calculation of temperature, phase composition and stresses and strains during heating and cooling are performed with selected programs. The results of the simulations are compared with the results of heat treating experiments. Heat transfer during heating-up varies considerably between different treatments, components of the charge and surfaces of the component. Therefore, heat transfer data defined on the basis of the measurements has to be used in exact simulation instead of literature data. According to the simulation results non-uniform temperature distribution, plastic straining and residual stresses after heating can be formed in an AISI 316 bar heated up at the edge of a charge in a pit furnace. Permanent bending of these bars as a result of heating is not observed. In the oil quenching of a 42CrMo4 cylinder, where martensite and bainite are formed in austenite decomposition, the simulation results (especially amounts of phases and residual stresses) are crucially dependent on the TTT-diagram describing the kinetics of the phase transformations. Several TTT-diagrams for the steel grade are found, leading to different simulation results.

6216 (WSRC-MS–94-0535) **MIC damage in a water coolant header for remote process equipment.** Jenkins, C.F. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Sep 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950304–2: National Association of Corrosion Engineers corrosion conference, Orlando, FL (United States), 20-25 Mar 1995). Order Number DE95002693. Source: OSTI; NTIS; INIS; GPO Dep.

Stainless steel water piping used to supply coolant for remote chemical separations equipment developed leaks during low flow conditions resulting from an extended interruption of operations. All the leaks occurred at welds in the bottom zone of the pipe, which was blanketed with silt deposits from the unfiltered well water used for cooling. Ultrasonic, radiographic, and metallographic examinations of leak sites revealed worm hole pitting adjacent to the welds. Seepage at the penetrations was strongly acidic and resulted in corrosion on the external pipe surfaces beneath brown crusty deposits which had developed. Analyses of the water and deposits suggest a strong propensity toward microbiologically influenced corrosion (MIC) and fouling.

(Brookhaven National Lab., Upton, NY (United States)); Li, Qiang; Fukumoto, Y.; Shibutani, K.; Wang, Y.L.; Wiesmann, H.J.; Haldar, P.; Motowidlo, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941014–1: Topical conference on the critical state in superconductors, Honolulu, HI (United States), 24-26 Oct 1994). Order Number DE95003952. Source: OSTI; NTIS; INIS; GPO Dep.

Detailed and high sensitivity ($E \geq 10^{-9}$ V/cm) measurements of J-E (I-V) characteristics were made for $Bi_2Sr_2Ca_2Cu_3O_{10}$/Ag composite tapes at 4.2, 2.7, 55-90, and 64-77 K in liquid cryogens and at H = 0-17 T. The results have helped clarify the critical current limiting factors as well as revealing a new low voltage dissipation phenomena in these composites. A brief summary of the results are presented.

6218 (CIEMAT–735) **Dielectric properties measurement system at cryogenic temperatures and microwave frequencies.** Molla, J.; Ibarra, A.; Margineda, J.; Zamarro, J.M.; Hernandez, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 17p. Order Number DE95721644. Source: OSTI; NTIS; INIS.

A system based on the resonant cavity method has been developed to measure the permittivity and loss tangent at 12-18 GHz over the temperature range 80 K to 300 K. Changes of permittivity as low as 0.01% in the range 1 to 30, and 3 x 10^6 for loss tangent values below 10^2, can be obtained without requiring temperature stability. The thermal expansion coefficient and resistivity factor of copper have been measured between 80 K and 300 K. Permittivity of sapphire and loss tangent of alumina of 99,9% purity in the same temperature range are presented.

6219 (CIEMAT–736) **Dielectric properties of alumina/zirconia composites at millimeter wavelengths.** Molla, J.; Heidinger, R.; Ibarra, A.; Link, G. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 16p. Order Number DE95721645. Source: OSTI; NTIS; INIS.

Alumina-zirconia composites with ZrO_2 contents up to 20% and negligible porosity were investigated at millimeter (mm) wavelengths to determine the changes appearing in the dielectric properties of pure alumina ceramics when unstabilized or partially stabilized ZrO_2 is added to improve the mechanical strength. It is demonstrated that it essential to distinguish between the contributions of the monoclinic and the tetragonal phase of zirconia (m-ZrO_2, t-ZrO_2). Permittivity is raised with increasing content of either phases; the effective permittivity can be assessed by the rule of mixtures (Maxwell-Garnett formulation of the generalized Clasussius-Mossotti relation) using permittivity values of 10 for Al_2O_3, 14-21 for m-ZrO_2 and 40-45 for t-ZrO_2. The permittivity data show only a small variation in the investigated range of 9-145 GHz. For the dielectric loss, there is evidence of a predominant contribution of m-ZrO_2; in addition, the marked increase in loss with frequency becomes sharper. The t-ZrO_2, which is responsible for strengthening, does not show any significant influence on losses. It is therefore concluded, that ZrO_2 strengthening of alumina is feasible without affecting mm-wave losses at room temperature as long as the presence of m-ZrO_2 is avoided.

6220 (ETDE/DE-mf–95726997) **Electrical properties of pure and TiO_2-doped tetragonal ZrO_2.** Kopp, A. Stuttgart Univ. (Germany). Fakultaet 3 - Chemie. 2 Nov 1992. 99p. (In German). Order Number DE95726997. Source: OSTI; NTIS (US Sales Only).

The ionic and electronic properties of undoped and TiO_2-doped tetragonal ZrO_2 were investigated. Electric conductivities were measured using impedance spectroscopy and the steady-state polarisation method according to Hebb and Wagner. The diffusion coefficients of the electronic charge carriers were derived from

transient-state polarisation measurements. The composition, the temperature, and the oxygen partial pressure of the ambient atmosphere were used as variables. (orig.)

6221 (ETDE/DE-mf–95733399) **The strength of brittle materials in the light of probabilistics.** Esslinger, P. MTU Motoren- und Turbinen-Union Muenchen GmbH (Germany). 10 Sep 1990. 30p. (In German). Order Number DE95733399. Source: OSTI; NTIS (US Sales Only).

An integral equation is derived for the fracture probability of structural ceramics (and of brittle materials in general). It contains a Weibull relationship as a special case. This results in a physical interpretation of the adaptation parameters of the Weibull relationship (m, V_0, σ_0). It also shows the points where material development should start in order to improve reliability. The influence of the surface area is quantified for tensile and bending test pieces. (orig./MM). 6 figs.

6222 (ETDE/JP-mf–95730104) **Study of composite zirconium oxide.** National Inst. for Research in Inorganic Materials, Tsukuba (Japan). 25 Nov 1993. 56p. (In Japanese). Order Number DE95730104. Source: OSTI; NTIS; Available from National Institute for Research in Inorganic Materials, 1-1, Namiki, Tsukuba, Ibaraki, Japan.

This paper is a collection of research reports of 1993 regarding inorganic materials published by Japan Science and Technology Agency. The research subject is ZrO2-MOx. The principal component of the composite oxide under research, ZrO2, is multifunctional and is widely used as a structural material. It is prospective for an optoceramics material such as PLZT or a material for intellectual functions. Unlike the existing techniques, excellent ceramics materials for fundamental study are produced and characterized by using a technique for synthesizing, characteristic composition, or nature (functions and properties). To summarize, the study include the wet adjusting method of raw powder material, uniform melting method of impurities such as SiO2 and CaO, effects of Mn ion on diffusion coefficient and piezo-electric characteristic of PLZT ceramics, sintering structure of easily sinterable Mg powder, effective partial pressure of oxygen at HIP, multistep wet synthesis of SrZrO3, destructive observation and 500°C fatigue cracking of ZrO2, intelligent intellectual elements, heat transfer degradation in fine area, and self-return. As a result of these researches, about 90 reports were presented on the paper and 56 patents were applied in Japan and 4 in other countries. 63 refs., 84 figs., 1 tab.

6223 (ETDE/JP-mf–95730106) **Study of copper perovskite.** National Inst. for Research in Inorganic Materials, Tsukuba (Japan). 25 Nov 1993. 68p. (In Japanese). Order Number DE95730106. Source: OSTI; NTIS; Available from National Institute for Research in Inorganic Materials, 1-1, Namiki, Tsukuba, Ibaraki, Japan.

This paper describes the research reports of 1993 regarding Cu Perovskite SC (Superconductor) published by Japan Science and Technology Agency. This is the study of superconductivity at a high critical temperature (Tc = 30 K or more) of copper-containing K2NiF4 type oxide. The study includes synthesis, characterization, and examination of substantial nature of this superconductor. Synthesis was conducted by applying the very fast cooling thick film synthesis method and some other methods. Characterization was achieved by observing the newly designed SXDM/XPD. The substantial nature was verified by using the Meissner effect measurement method. Amorphous film of Bi series oxide SC was created by applying the very fast cooling method for the first time in the world. Bi-Pb thick film was created, and high-orientation film was produced on the trial basis. The complete C-axis orientation film of (Nd - Ce) $_2$CuO4 could be produced on the trial basis by using the sputtering method. Copper-containing oxide was synthesized at a high oxygen pressure, and the substantial nature of magnetic oxide was examined at a high pressure. The quality of lead germanate could also be improved by using the very fast cooling method. Each study subject is partially successful through the newly proposed techniques, but many issues to be corrected are still in the most part of each study. 108 refs., 127 figs., 8 tabs.

6224 (LA-UR–94-1390) **Transport properties of $Tl_2Ba_2CaCu_2O_8$ meander lines.** Fleshler, S.; Maley, M.P.; Jia, Quanxi; Wu, Xin Di; Lacerda, A. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941013–13: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95003715. Source: OSTI; NTIS; GPO Dep.

The authors have measured the electrical transport properties of 10 cm long $Tl_2Ba_2CaCu_2O_8$ thin film meander lines in magnetic fields up to 18T. The large resistance of the meander line effectively increased the electric field, or equivalently, resistivity sensitivity by two orders of magnitude. In moderate magnetic fields the critical current density is found to depend only on the component of the magnetic field normal to the ab planes owing to the highly anisotropic nature of the system. The resistivity versus temperature was measured as a function of magnetic field up to 18T. The linear resistivity is found to vanish in a manner consistent with the occurrence of a second order phase transition. The critical exponent v(z-1) is virtually field independent with a value 5.3 $\pm$1 consistent with previous measurements of a three dimensional vortex glass transition in $YBa_2Cu_3O_7$ and $Bi_2Sr_2CaCu_2O_8$. The critical regime is 10-15K wide in agreement with values for $Bi_2Sr_2CaCu_2O_8$ at high magnetic field.

6225 (LA-UR–94-3789) **Preparation of high quality $YBa_2Cu_3O_{7-\delta}$ thick films on flexible Ni-based alloy substrates with textured buffer layers.** Wu, X.D. (and others); Foltyn, S.R.; Arendt, P.; Townsend, J.; Campbell, I.H.; Tiwari, P.; Jia, W.X.; Willis, J.O.; Maley, M.P.; Coulter, J.Y. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941013–1: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95003686. Source: OSTI; NTIS; GPO Dep.

High current $YBa_2Cu_3O_{7-\delta}$ (YBCO) thick films on flexible nickel substrates with textured buffer layers were deposited by using ion beam assisted deposition (IBAD). Pulsed laser deposited YBCO films were not only c-axis oriented with respect to the film surface but also strongly in-plane textured. The in-plane mosaic spread of YBCO films was $\sim 10°$. A critical current density of $8x10^5$ A/cm^2 was obtained at 75 K and zero field for thin YBCO films. It was also demonstrated that thick YBCO films with a high critical current and excellent magnetic field dependence at liquid nitrogen temperature can be obtained on flexible nickel substrates by using the textured buffer layers. Issues encountered in producing the films were discussed.

6226 (LA-UR–94-3850) **Effect on C-axis transport properties of a critical state in $Bi_2Sr_2CaCu_2O_8$.** Cho, J.H.; Maley, M.P.; Bulaevskii, L.N. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941013–12: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95003695. Source: OSTI; NTIS; GPO Dep.

At low temperatures, the c-axis transport properties of $Bi_2Sr_2CaCu_2O_8$ single crystals depend strongly on the magnetic field history for fields applied along the c-axis, indicating the effect of a critical state in the ab direction. In this study, the authors report zero field cooled (ZFC), field cooled warming (FCW), and field cooled cooling (FCC) c-axis transport properties. In addition, they also report magnetic relaxation measurements on the same samples to identify the c-axis dissipation mechanism. They observe a relaxation of the c-axis resistivity that follows the relaxation of the flux profile across the ab plane. By identifying the irreversible temperature vs. magnetic field for H //c, they construct a phase diagram of vortex states. Finally, they will discuss the implication of the phase diagram and the features related to the transport properties of the Josephson-coupled system and the role of pancake vortices in highly two-dimensional superconductors.

6227 (LA-UR–94-3930) **Electrochemical studies of perovskite mixed conductors.** Brosha, E.L. (Los Alamos National Lab., NM (United States). Electronic and Electrochemical Materials and Devices Group); Chung, B.W.; Garzon, F.H. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–15: 1994 fall meeting of the Materials Research

Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003704. Source: OSTI; NTIS; GPO Dep.

Research into the growth of high-quality single crystal thin films of high transition temperature T_c superconductors have stimulated interest in other perovskite metal oxides with a variety of physical properties. Thin films of perovskite materials are among the major focal research areas for optical, sensor, electronic, and superconducting applications. Two lanthanum-based oxygen/electronic conducting perovskite oxides of particular interest for high temperature fuel cell electrodes and interconnects and for other electrochemical applications such as oxygen separation devices are $La_{1-x}Sr_xMnO_{3-y}$ and $La_{1-x}Sr_xCoO_{3-y}$. The La-based perovskites are valuable for these technologies because they reduce interfacial resistances by eliminating the need for a three phase contact area (gas, metal electrode, electrolyte). In addition, these oxides may also serve a valuable role as novel catalysts or catalytic supports; however, little is known about what catalytic properties they may possess. Fundamental study of the electrochemical, diffusional oxygen transport, and surface catalytic properties of these materials can be greatly simplified if the complications associated with the presence of grain boundaries and multiple crystallite orientations can be avoided. Therefore, single crystals of these La-based perovskites become highly desirable. In this work, the authors report the structural and electrical properties of highly oriented thin films of $La_{0.84}Sr_{0.16}MnO_3$ and $La_{0.8}Sr_{0.2}CoO_3$ grown on single crystal Y-ZrO_2 substrates. An addition, the authors have demonstrated growing, in situ, epitaxial multilayer perovskite/fluorite/perovskite configurations for fundamental fuel cell modeling.

6228 (LA-UR–94-3935) **Vapor deposition of thin-film Y-doped ZrO_2 for electrochemical device applications.** Chung, B.W.; Brosha, E.L.; Brown, D.R.; Garzon, F.H. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–13: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003705. Source: OSTI; NTIS; GPO Dep.

Solid oxide electrolytes based on yttria-stabilized zirconia (YSZ) are widely used in applications such as oxygen sensors, solid oxide fuel cells, oxygen pumps, electrocatalytic reactors, and electrochemically driven oxygen separation membranes. However, bulk YSZ is used in these applications. This requires high operating temperatures in order to minimize ohmic loss. One alternative of overcoming this problem is to use a thin film of the electrolyte. In the work, the authors have grown polycrystalline thin films of fully stabilized Y-ZrO_2 on thick porous Al_2O_3 substrates in multilayer $La_{1-x}Sr_xMEO_3$YSZ/$La_{1-x}Sr_xMEO_3$ (ME = Mn, Co) configurations using a combination of single-target RF magnetron sputtering and electron beam physical vapor deposition techniques. The structure and morphology of these films have been studied using X-ray diffraction, and Scanning Electron Microscopy techniques. The ionic conductivity of the thin films has been measured using AC impedance analysis.

6229 (LA-UR–94-3966) **Thin film ionic conductors based on cerium oxide.** Haridoss, P. (Univ. of Wisconsin, Madison, WI (United States)); Hellstrom, E.; Garzon, F.H.; Brown, D.R.; Hawley, M. Los Alamos National Lab., NM (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–9: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003668. Source: OSTI; NTIS; INIS; GPO Dep.

Fluorite and perovskite structure cerium oxide based ceramics are a class of materials that may exhibit good oxygen ion and/or protonic conductivity. The authors have successfully deposited thin films of these materials on a variety of substrates. Interesting orientation relationships were noticed between cerium oxide films and strontium titanate bi-crystal substrates. Near lattice site coincidence theory has been used to study these relationships.

6230 (LA-UR–94-4052) **Orientation selection and microstructural evolution of epitaxial platinum films on (001) magnesium oxide.** McIntyre, P.C.; Maggiore, C.J.; Natasi, M. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–3: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003680. Source: OSTI; NTIS; GPO Dep.

Thin platinum films were deposited at several different deposition rates and with varying thickness on (001)-cut MgO single crystal substrates by electron beam evaporation. A mixture of two epitaxial Pt orientations were detected in the films by X-ray diffraction and planar ion channeling experiments: (001)[100]Pt //(001)[100]MgO (the "cube-on-cube" orientation) and (111)[110]Pt //(001)[110]MgO. The effect of deposition rate on film orientation indicated the (111)Pt orientation was preferred under conditions of high driving force for nucleation. The volume fraction of the films occupied by the (111) orientation increased with nominal film thickness, at a constant substrate temperature and deposition rate. This result indicates crystallites having the (111)Pt orientation grew more quickly following nucleation than the (001). The mosaic spread of the Pt orientation decreased markedly as the nominal film thickness increased from ~ 1.5 nm (isolated islands) to 20 nm (continuous film).

6231 (LBL–36149) **Ion-assisted laser deposition of intermediate layers for $YBa_2Cu_3O_{7-\delta}$ thin film growth on polycrystalline and amorphous substrates.** Reade, R.P. Lawrence Berkeley Lab., CA (United States). Nov 1993. 117p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003507. Source: OSTI; NTIS; GPO Dep.

The growth of $YBa_2Cu_3O_{7-\delta}$ (YBCO) high-temperature superconductor thin films has largely been limited to deposition on single-crystal substrates to date. In order to expand the range of potential applications, growth on polycrystalline and amorphous substrates is desirable. In particular, the deposition of YBCO thin films with high critical current densities on polycrystalline metal alloys would allow the manufacture of superconducting tapes. However, it is shown that it is not possible to grow YBCO thin films directly on this type of substrate due to chemical and structural incompatibility. This work investigates the use of a yttria-stabilized zirconia (YSZ) intermediate layer to address this problem. An ion-assisted pulsed-laser deposition process is developed to provide control of orientation during the growth of the YSZ layers. The important properties of YBCO and YSZ are summarized and the status of research on thin film growth of these materials is reviewed. An overview of the pulsed-laser deposition (PLD) technique is presented. The use of ion-assisted deposition techniques to control thin film properties is discussed.

Eidgenoessische Technische Hochschule, Zurich (Switzerland). Lab. fuer Neutronenstreuung. Oct 1994. 137p. (In German). Order Number DE95610881. Source: OSTI; NTIS; INIS.

Dissertation ETH-Zurich.

The perovskite-type high-T_c compounds $RBa_2Cu_3O_x$ (R=Y, most rare earths, except Ce and Tb) does not exhibit superconductivity. Until today there is no generally accepted explanation for the unusual behaviour of the Pr system. The suppression of superconductivity in the $RBa_2Cu_3O_7$ compound is related to an electronic change which should also influence the structural parameters. To check this assumption, a systematic low temperature neutron-diffraction study was made of the $RBa_2Cu_3O_x$ (R=Y and rare earth; x=7 and 6.1) compounds. Comparison of various interatomic distances in function of the radius of the trivalent rare earths exhibit the well known lanthanide contraction with the exception of the bond lengths of Pr-O(2), Cu(2)-Cu(2) and Cu(2)-O(3) in $PrBa_2Cu_3O_7$ which are much shorter compared to the other lanthanide compounds. This shortening of the bond lengths must be related to suppression of superconductivity in $PrBa_2Cu_3O_7$. This tendency was also observed for the $Er_{1-y}Pr_yBa_2Cu_3O_x$ system. Furthermore structure analyses show a critical buckling angle in the CuO_2 planes: if the buckling is larger than a critical value of 167.3°, superconductivity is destroyed. In fast neutron irradiated $ErBa_2Cu_3O_7$ samples (this treatment decreases T_c) we also observed a tendency towards this critical value. Indeed, for

$PrBa_2Cu_3O_7$ we found the buckling angle to be above the critical value. By means of inelastic neutron scattering we were able to show that the superconductivity in the mixed $Er_{1-y}Pr_yBa_2Cu_3O_x$ system is only locally destroyed by the Pr ions, and their influence on the crystalline electric field at the Er site can be explained by a small structural distortion. 6233 (ORNL/FMP–94/1, pp. 99-104) **Modeling of fibrous preforms for CVI fabrication.** Starr, T.L. (Georgia Institute of Technology, Atlanta, GA (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

We describe our ongoing efforts toward modeling the chemical vapor infiltration (CVI) of tube shapes, in support of experimental process development at Oak Ridge National Laboratory (ORNL). Model modifications needed to match the ORNL reactor include adding radiant heat transfer and adjusting heat transport conditions at the tube ends. Model densification times are in good agreement with experiment. For this preform geometry higher gas flow rate and MTS concentration are needed for rapid densification. Higher furnace temperature can be used at these higher gas flow rates and as the tube densifies. A strategy for optimized processing may involve continuous variation of furnace temperature and control of gas flow rate for efficient utilization of MTS.

6234 (ORNL/FMP–94/1, pp. 105-116) **Development of oxidation-resistant interface coatings.** Lowden, R.A. (Oak Ridge National Lab., TN (United States)); Schwarz, O.J.; Stinton, D.P. Oak Ridge National Lab., TN (United States). Aug 1994. DOE Contract AC05-84OR21400. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). Porous silicon carbide (SiC) was examined as an interlayer to improve the elevated-temperature stability of Nicalon/SiC composites. Porous SiC coatings were deposited on fibrous preforms from gas mixtures containing methylsilane (CH_3SiH_3), methane (CH_4), argon, and hydrogen. The effects of the carbon to silicon ratio and the concentration of hydrogen in the gas mixture, on the microstructure and composition of the SiC interlayer were examined. The coated preforms were densified with a silicon carbide matrix using the forced-flow, thermal-gradient chemical vapor infiltration (FCVI) process. Room-temperature flexure strengths of as-fabricated composites and specimens exposed to 1273 K in air for 24 h, were measured to assess the effectiveness of the interlayer. Layer thickness, microstructure, and composition influenced as-fabricated and post-exposure properties. Materials fabricated with a variety of porous SiC coatings showed improvements in retained strength as compared to those with traditional carbon coatings.

6235 (ORNL/FMP–94/1, pp. 117-124) **Joining of SiC ceramics and SiC/SiC composites.** Rabin, B.H. (Idaho National Engineering Laboratory, Idaho Falls, ID (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Reaction processing methods have been developed and employed to produce SiC-to-SiC joints for use in elevated temperature fossil energy applications. The strength and fracture toughness of joints were characterized and found to be comparable to commercial bulk reaction bonded silicon carbide (RBSC), making these joints potentially useful for service temperatures exceeding 1000°C. Recent efforts have focused on constructing and testing a localized induction heating apparatus for fabricating tube-to-tube joints. It has been demonstrated that microstructurally sound tube-to-tube joints can be produced; further research is needed to evaluate the properties of joined tubular components, and to scale up the process to allow larger diameter and longer length tubes to be handled. Technology transfer activities involving industry are discussed.

6236 (ORNL/FMP–94/1, pp. 125-136) **Densification of nano-size powders.** Chen, W. (National Institute of Standards and Technology, Bethesda, MD (United States)); Malghan, S.G.; Dapkunas, S.J.; Piermarini, G.; Danforth, S.C. Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Green compacts from a nano-size silicon nitride powder were fabricated having density up to 67% of theoretical at 2.8 GPa pressure using liquid nitrogen and pentane as compaction lubricant media. Pressureless sintering of these transparent samples did not promote further densification beyond that obtained for the green state. To further increase the density of these samples, a hot-pressing device was designed. In a series of experiments, hot-pressing of these samples at 0.5 to 1.0 GPa and 800°C, followed by pressureless sintering at 1400°C was studied. The resulting silicon nitride ceramic had a Vickers hardness of 9.0 GPa while transparency under visible light was maintained. Without the use of hot pressing, the hardness obtained was 5.8 GPa. In addition, the effect of compaction pressure on densification was studied for nano-size Al_2O_3 to further understand factors contributing to achieving high green densities. The dense Al_2O_3 green samples were pressureless sintered to near full density at temperatures several hundred degrees lower than those needed for sintering low density green material.

6237 (ORNL/FMP–94/1, pp. 163-168) **Microwave-assisted chemical vapor deposition.** Janney, M.A. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

The purpose of this research is to explore the feasibility of using microwave heating to enhance the chemical vapor infiltration (CVI) process developed under FEMP sponsorship. The goal is to achieve faster deposition rates, greater control over deposition conditions and resulting microstructures, and perhaps lower temperature infiltration.

6238 (ORNL/TM–12778) **Ceramic Technology Project, semiannual progress report for October 1993 through March 1994.** Johnson, D.R. Oak Ridge National Lab., TN (United States). Sep 1994. 456p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95003394. Source: OSTI; NTIS; GPO Dep.

The Ceramic Technology Project was originally developed by the Department of Energy's Office of Transportation Systems (OTS) in Conservation and Renewable Energy. Significant accomplishments in fabricating ceramic components for the Department of Energy (DOE), National Aeronautics and Space Administration (NASA), and Department of Defense (DoD) advanced heat engine programs have provided evidence that the operation of ceramic parts in high-temperature engine environments is feasible. An assessment of needs was completed, and a five-year project plan was developed with extensive input from private industry. In July 1990, the original plan was updated through the estimated completion of development in 1993. The original objective of the project was to develop the industrial technology base required for reliable ceramics for application in advanced automotive heat engines. During the course of the Ceramic Technology Project, remarkable progress has been made in the development of reliable structural ceramics. The direction of the Ceramic Technology Project is now shifting toward reducing the cost of ceramics to facilitate commercial introduction of ceramic components for near-term engine applications. In response to extensive input from industry, the plan is to extend the engine types which were previously supported (advanced gas turbine and low-heat-rejection diesel engines) to include near-term (5-10 years) applications in conventional automobile and diesel truck engines. To facilitate the rapid transfer of this technology to U.S. industry, the major portion of the work is being done in the

ceramic industry, with technological support from government laboratories, other industrial laboratories, and universities. A systematic approach to reducing the cost of components is envisioned.

6239 (SAND–94-8415C) **Transport in chemical vapor deposition reactors: A two-dimensional model including multicomponent and thermal diffusion, and species interdiffusion.** Evans, G. (Sandia National Labs., Livermore, CA (United States)); Greif, R. Sandia National Labs., Livermore, CA (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Contract F33615-89-C-5628. (CONF-950336–5: American Society of Mechanical Engineers/Japanese Society of Mechanical Engineers/Japan Solar Energy Society international solar energy conference, Maui, HI (United States), 19-24 Mar 1995). Order Number DE95002484. Source: OSTI; NTIS; GPO Dep.

The chemical vapor deposition (CVD) process that consists of depositing coatings of silicon nitride from silicon tetrafluoride and ammonia at low-pressure is modeled in a reactor simulation. Combined effects of surface chemical kinetics, multicomponent diffusion, convection, thermal diffusion, species interdiffusion, and variable properties are included in a reactor model. Full multicomponent diffusion is included by solving the StefanMaxwell equations. Species interdiffusion and thermal diffusion are included in the energy and species conservation equations. Results are for five gas phase species with two surface reactions specified for the deposition. Distributions of radial and axial components of velocity, species, temperature, and deposition rate and deposition profile are obtained in a tube reactor. Effects of the combined transport mechanisms noted above are determined. The decomposition of NH_3 into N_2 and $H2_2$ retards deposition of silicon nitride and dilutes the incoming reactants. This dilution is strongly enhanced by thermal diffusion since the direction of the temperature gradient causes the light species generated by the surface reactions to remain near the surface resulting in smaller and nonmonotonic deposition rates. The effects of a ramp in the surface temperature on the deposition rate and profile and on the transport processes are also determined.

Quasi-elastic neutron scattering is used to study the disordering processes in two classes of semiconductor: I-IV Zintl compounds and the phosphorus-selenium system. Two alkali-metal-polyvalent metal Zintl compounds, CsPb and NaSn, exhibit a two-stage melting process with high-temperature solid phases characterized by rapid dynamical disorder. In CsPb this disorder is clearly associated with rapid reorientations of polyanions with the cations participating in the dynamical disorder on the same time scale. In NaSn the disorder is associated with fast reorientations of the polyanions closely coupled to a slower migration of the cations. The two high-temperature solid phases of the molecular crystal P_4Se_3 are confirmed to be rotor phases with small but significant differences in the reorientational motions in the two phases. Zintl compounds are formed from an electropositive metal A and an electronegative metal on semimetal M. Electron transfer from A to M, along with directional bonding between the M-ions, leads to chemical behavior in these ions characteristic of elements to the right of M in the periodic table.

6241 (BDX–613-531) **A study of polyether-polyol- and polyester-polyol-based rigid urethane foam systems.** Madden, J.P.; Baker, G.K.; Smith, C.H. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Sep 1971. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-710913–1: 162. national meeting of the American Chemical Society, Washington, DC (United States), 12-17 Sep 1971). Order Number DE95003899. Source: OSTI; NTIS; GPO Dep.

For the past 10 years polyurethane polymers have been one of the fastest growing segments of the plastics industry. Over 900 million pounds of polyurethanes were used in 1970. Approximately 30% of this amount was consumed in the form of rigid urethane foam products. This study undertakes a comparison of the properties of rigid urethane foams based on both a polyester polyol and polyether polyol of the same hydroxyl number prepared from alpha methylglucoside. This comparison of ester and ether polyols in urethane foams is closer than in previous studies because: (1) both types of polyols are based on alpha methylglucoside; (2) they both have the same hydroxyl number and functionality; and (3) the rigid foams in which they are used have been formulated to have essentially the same crosslink density. Several physical and thermal properties of the foam systems were determined. A discussion of test results as they relate to the presence of the ester and ether linkages in the polyols is presented.

Brookhaven National Lab., Upton, NY (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940829–1: 14. international colloquium on magnetic films and surfaces, Duesseldorf (Germany), 29 Aug - 2 sep 1994). Order Number DE95004218. Source: OSTI; NTIS; GPO Dep.

There is currently considerable technological interest in the properties of transition metal multilayers. In these multilayers, which include Fe/Cr(001) and Cu/Co(001), it is possible to achieve either ferromagnetic or antiferromagnetic coupling of the adjacent ferromagnetic layers depending on the thickness of the intervening layer. The related giant magnetoresistance properties and the large enhancement of the Kerr rotation in these systems make them particularly interesting. In this paper, quantum well states with discrete binding energies dependent on the thickness of the film are observed in copper films deposited on a Co(001) substrate. They are found to be spin polarized, preferentially with minority spin. These states pass up to and through the Fermi level with a frequency identical to the long period of oscillation in the associated magnetic multilayers. In the pre-asymptotic limit the dispersion of these states away from the center of the zone is described by enhanced effective masses. This has implications for theories of the oscillatory exchange coupling that invoke the bulk Fermi surface.

6243 (BNL–60904) **Profiling and light scattering studies of Si surfaces.** Church, E.L. (Brookhaven National Lab., Upton, NY (United States)); Takacs, P.Z.; Stover, J.C. Brookhaven National Lab., Upton, NY (United States). Oct 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950246–1: Microphysics of surfaces: nanoscale processing meeting, Santa Fe, NM (United States), 9-11 Feb 1995). Order Number DE95002931. Source: OSTI; NTIS; GPO Dep.

There is great interest in the semiconductor industry in developing light-scattering techniques for detecting "killer particles" on Si wafer surfaces. The surface power spectral density (PSD) is important since it determines the intensity and angular dependence of the background scattering; understanding it will lead to a deeper understanding of finishing processes. Scattering measurements showed that Si wafer surfaces have the radiation-wavelength and angular dependences expected for weak topographic scattering. The data and independent profile measurements were used to deduce consistent values of the surface PSDs over the wavelength range 50 nm to 1 mm. The profile PSDs were found to consist of a sum of inverse power-law components, i.e., the surfaces are fractal-like. There is an analogy between the results and spontaneous thermodynamic roughening of solid surfaces: Below the critical roughening temperature, the surface topography is determined by the underlying crystal structure, while above it, the

surface "melts" and the roughness is determined by capillary-wave excitations of the surface. Capillary waves have the well-known $1/f_x$ profile power spectrum.

6244 (DOE/CE/15974–T9) **Progress report on conductive paints, September 1, 1994–November 30, 1994.** Soukup, R.J. Ianno, N.J. Nebraska Univ., Lincoln, NE (United States). [1995]. 7p. Active solders were developed by which both ZrO_2, Al_2O_3 and Si_3N_4 can be reliably joined. By the development of ductile active solders and the optimisation of the joint geometry, high adhesion can be achieved with simultaneous low stresses in the ceramic. The rocker arm was chosen as the component on which a ceramic layer is to be soldered for protection against wear. The ceramics to be soldered are zirconium oxide, Al_2O_3 dispersion ceramic and silicon nitride. Apart from the requirement for good adhesion, the stresses in the metal/ceramic compound material must simultaneously be minimised. The stresses are caused by the different thermal expansions of ceramics and steel. (orig.). 3 tabs., 91 figs.

6247 (JAERI-Research–94-016) **Evaluation of strength properties of developed SiC/C compositionally gradient graphite materials.** Nakano, Junichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Fujii, Kimio; Shindo, Masami. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 29p. (In Japanese). Order Number DE95737271. Source: OSTI; NTIS; INIS.

To evaluate the influence of surface SiC coating and intermediate SiC/C layers on the mechanical strength of graphite matrix of the developed compositionally gradient graphite materials, which are composed of a surface SiC coating layer, an intermediate SiC/C layer and a graphite matrix, bending and compressive tests were carried out for SiC/C compositionally gradient graphite materials, SiC coated graphite materials, graphite materials with the intermediate SiC/C and virgin graphite materials at room temperature. The results of the tests were discussed in comparison with the specific surface areas which is a measure for the surface condition of samples. For the graphite with the intermediate SiC/C layer, the strength was independent of the Si content in the intermediate SiC/C layer and almost the same as that for the graphite substrate, although the specific surface area increased with an increase in the Si content in the intermediate SiC/C layer. The strength of the surface SiC coated specimens, i.e., SiC/C compositionally gradient graphite materials and SiC coated graphite materials, was about twice as that of the respective substrate, i.e., the graphite with the intermediate SiC/C layer and the virgin graphite. (author).

6248 (LA-UR–94-3470) **Vibration testing of the I-40 bridge before and after the introduction of damage.** Farrar, C.R.; Cone, K.M. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by Federal Highway Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950240–3: International modal analysis conference, Nashville, TN (United States), 13-16 Feb 1995). Order Number DE95002711. Source: OSTI; NTIS; GPO Dep.

Because the bridges over the Rio Grande were to be razed, the investigators were able to introduce simulated cracks in four stages of increasing length into the structure. This paper summarizes the results of ambient and conventional, measured-input, modal analyses, performed on the undamaged structure. Also summarized are the results of conventional modal analyses performed after each stage of damage had been introduced. These tests were intended to quantify the amount of damage necessary to produce changes in the global dynamic properties of the bridge and to form a data base that can be used by other investigators to develop damage identification algorithms. Conventional modal analysis identified changes in the global dynamic properties of the structure only after the final stage of a damage.

6249 (LA-UR–94-3958) **Composite ductility: The role of reinforcement and matrix.** Shi, N. (Los Alamos National Lab., NM (United States)); Arsenault, R.J. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Contract N00014-9410118. (CONF-950201–1: Annual meeting and exhibition of the Minerals, Metals and Materials Society, Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95003664. Source: OSTI; NTIS; GPO Dep.

The total ductility, i.e., the energy required to rupture a ductile solid is controlled by two factors: (1) ability to withstand strain hardening before initiation of critical nuclei for final rupture (microcracks or voids); (2) resistance to crack extension. The first group is related to the reinforcement; particle or whisker fracture, debonding and void nucleation and growth at the reinforcement-matrix interface. The second group is related to the matrix; triaxial stress state in matrix, the work hardened state of the matrix due to the ΔCTE effect, and localized matrix plastic flow. The experimental data and theoretical analysis show that the lack of strain hardening capacity of the matrix is the major contributing factor causing the low ductility of DMMCS (discontinuous metal matrix composities). This may be attributed intrinsically to the exhaustion of the strain hardening capacity from ΔCTEinduced work hardening and/or extrinsically to the high matrix triaxial stresses which induces rapid void growth.

6250 (LA-UR–94-4043) **Internal strain measurement using pulsed neutron diffraction at LANSCE.** Goldstone, J.A. (Los Alamos National Lab., NM (United States). Manuel Lujan Jr. Neutron Scattering Center); Bourke, M.A.M.; Shi, N. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–11: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003677. Source: OSTI; NTIS; INIS; GPO Dep.

The presence of residual stress in engineering components can effect their mechanical properties and structural integrity. Neutron diffraction in the only technique that can make nondestructive measurements in the interior of components. By recording the change in crystalline lattice spacings, elastic strains can be measured for individual lattice reflections. Using a pulsed neutron source, all lattice reflections are recorded in each measurement, which allows for easy examination of heterogeneous materials such as metal matrix composites. Measurements made at the Manuel Lujan Jr. Neutron Scattering Center (LANSCE) demonstrate the potential at pulsed sources for in-situ stress measurements at ambient and elevated temperatures.

6251 (LA-UR–94-4051) **Temperature effects on ion irradiation damage in $MgAl_2O_4$ spinel single crystals.** Yu, Ning; Sickafus, K.E.; Nastasi, M. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–7:

1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003679. Source: OSTI; NTIS; GPO Dep.

$MgAl_2O_4$ monecrystals, <100> oriented, were irradiated at 100 and 670 K with 370–400 KeV Xe ions to doses of (1-2) x 10^{16} Xe/cm^2. Microstructures of irradiated samples were examined by cross-sectional TEM at RT. A uniform layer of amorphous phase was found on the surface of spinel irradiated at 100 K. At the end of the damage range underlying the amorphous layer, a disordered transition layer resided on the undamaged substrate. The transition layer retained single crystallinity having epitaxial relation with underlying substrate. However, <220> reflections in the transition layer diminished compared to undamaged spinel. No amorphization was found in spinel irradiated at 670 K to 2 x ^{16} Xe/cm^2. Partial diminishing of intensity of <220> reflections was observed in the heavily damaged region. The missing or reduction of <220> reflections suggests that spinel experiences a structural transition from original cubic phase (a=0.808 nm) to a new cubic phase (a=0.404 nm). A phase sequence from the original spinel to a metastable spinel and then to an amorphous spinel has been found. Temperature dependence of metastable and amorphous phase formation showed that the accumulation efficiency of cation disorder decreases with increasing irradiation temperature due to the enhanced mechanism of interstitial-vacancy recombination.

6252 (LBL–35434) **Annealing of nitrogen-doped ZnSe at high pressures: Toward suppression of native defect formation.** Chen, A.L. (Lawrence Berkeley Lab., CA (United States)); Walukiewicz, W.; Haller, E.E.; Luo, H.; Karczewski, G.; Furdyna, J. Lawrence Berkeley Lab., CA (United States). Jul 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940981–4: 21. international symposium on compound semiconductors, San Diego, CA (United States), 18-22 Sep 1994). Order Number DE95003420. Source: OSTI; NTIS; GPO Dep.

Pressure is shown to have a drastic effect an the annealing characteristics of p-type, nitrogen-doped ZnSe. Samples annealed in vacuum show decreased carrier concentrations and simultaneous formation of deep-donor-related luminescence, while samples annealed under pressure show suppression of this compensating donor. Results are interpreted as an increase in the formation energy of the compensating deep donor under pressure. In addition the samples annealed under pressure show emergence of a new, intense, green luminescence band centered at 2.44 eV. The magnitude of the shift of this Peak under applied stress suggests that it results from a recombination involving a deep acceptor.

6253 (LBL–36256) **Carbon doping of III-V compound semiconductors.** Moll, A.J. Lawrence Berkeley Lab., CA (United States). Sep 1994. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003431. Source: OSTI; NTIS; GPO Dep.

Focus of the study is C acceptor doping of GaAs, since C diffusion coefficient is at least one order of magnitude lower than that of other common p-type dopants in GaAs. C ion implantation results in a concentration of free holes in the valence band < 10% of that of the implanted C atoms for doses > 10^{14}/cm^2. Rutherford backscattering, electrical measurements, Raman spectroscopy, and Fourier transform infrared spectroscopy were amonth the techniques used. Ga co-implantation increased the C activation in two steps: first, the additional radiation damage creates vacant As sites that the implanted C can occupy, and second, it maintains the stoichiometry of the implanted layer, reducing the number of compensating native defects. In InP, the behavior of C was different from that in GaAs. C acts as n-type dopant in the In site; however, its incorporation by implantation was difficult to control; experiments using P co-implants were inconsistent. The lattice position of inactive C in GaAs in implanted and epitaxial layers is discussed; evidence for formation of C precipitates in GaAs and InP was found. Correlation of the results with literature on C doping in III-V semiconductors led to a phenomenological description of C in III-V compounds (particularly GaAs): The behavior of C is controlled by the chemical nature of C and the instrinsic Fermi level stabilization energy of the material.

6254 (LUTFD2-TFKF–1016/1-161(1994)) **Mass and energy dispersive recoil spectrometry of GaAs structures.** Hult, M. Lund Univ. (Sweden). Dept. of Nuclear Physics. 26 Aug 1994. 88p. Order Number DE95610891. Source: OSTI; NTIS; INIS.

Mass and energy dispersive Recoil Spectrometry (RS) using heavy ions at energies of about 0.2A-0.8A MeV has attracted much interest recently due to its potential for separately and unambiguously generating information on isotopic depth distributions. The principal advantages of mass and energy dispersive RS are that both light and heavy elements can be separately studied simultaneously and problems caused by chemical matrix effects are avoided since the technique is based on high energy nucleus-nucleus scattering. In order to elucidate reactions taking place in various GaAs structures, Time of flight-Energy (ToF-E) RS was developed to allow Ga and As to be studied separately down to depths of about 500-800 nm with a depth resolution of about 16 nm at the surface. This was shown in a study of an $Al_xGa_{1-x}As$ quantum-well structure. The benefits of using ToF-E RS on GaAs structures were further demonstrated in studies of Co/GaAs and $CoSi_2$/GaAs reactions, as well as in a study of the composition of MOCVD grown $Al_xGa_{1-x}As$. Most recoil measurements employed ^{127}I at energies of about 50-90 MeV as projectiles. The recoil detector telescope consisted of a silicon energy detector and two carbon foil time pick-off detectors separated by a variable flight length of 213.5-961 mm. The reactions taking place between various thin films and GaAs were also studied using complementary techniques such as XRD, XPS and SEM. Co was found to react extensively with GaAs, already at about 300 degrees C, making it unsuitable as a contact material. Thin films of Co and Si were found to react extensively with each other and to form $CoSi_2$ at 500 degrees C and above. $CoSi_2$, a low resistivity silicide, turned out to be stable on GaAs, at least up to 700 degrees C. Considerable grain growth could cause problems, however, in the use of $CoSi_2$-contacts. 112 refs, figs, tabs.

6255 (NUTEK-FJV–94-6, pp. 1-38 (paper I)) **Thermal conductivity and gas diffusion of rigid PUR foam. Part 1. Study of thermal conductivity and gas analysis for PUR insulation made with the blowing agents CFC 11, HCFC 141b and CO_2.** Jarfelt, U. (Division of Building Technology, Chalmers University of Technology, Gothenburg (Sweden)). Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

The change in thermal conductivity as a function of time for rigid polyurethane foam made with different blowing agents has been studied in this project which is the first in a series of tests on different blowing agents and material properties. This first report sets out the results relating to the composition of the cell gases over a period of 100 days in slabs of polyurethane of different densities, made with different blowing agents, CO_2, CFC 11 and HCFC 141b. The test specimens were made in a high pressure machine, and the same mix compositions were used as far as possible. The polyol and isocyanate were not varied between the test materials. Differences in density were brought about by different degrees of over-packing. The thermal conductivity of slabs of 30 mm thickness was studied in a plate apparatus over a period of 100 days. Parallel with this determination, gas analyses were made on cell gas contained in the polyurethane material. On the bases of the partial pressure obtained, the diffusion coefficient for the blowing agents, oxygen and nitrogen was determined. 5 refs, 33 figs, 2 tabs

6256 (NUTEK-FJV–94-6, pp. 1-32 (paper II)) **A method for analysing the gas phase in polyurethane foam.** Ramnaes, O. (Division of Chemical Environmental Science, Chalmers University of Technology, Gothenburg (Sweden)); Svanstroem, M. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

Also published by Chalmers Univ. of Technology, Div. of Building Technology as Publ 94:1.

The insulative properties of a polymer foam depend upon the properties of the polymer, such as cell size, density and number of closed cells, and upon the thermal conductivities of the captive cell

gases. The blowing agents tend to diffuse out of and air into the foam. This diffusion leads to a change in the cell gas composition over time and a continuous increase in the thermal conductivity. It is consequently of interest to determine the cell gas composition of a foam at different times. Quantitative analyses of the cell gases can be used to study the ageing behaviour of a foam, to determine diffusion coefficients for different gases and to calculate the thermal conductivity of the foam. Different methods have been described for the determination of cell gas composition. In order to collect the gas phases from a large number of cells, the cell structure must be destroyed. This has been effected by cooling the sample in liquid nitrogen and then crushing the brittle foam. In the present work, a sampling method similar to that suggested by Du Cauze de Nazalle was used initially. The gas phase was collected when the foam was simultaneously twisted and compressed ('squeezed'). In order to eliminate the risk of an increased amount of blowing gas dissolving in the solid polymer during sampling, when the pressure is high, another sampling method, where the foam was ground, was tried. Both methods, the 'squeezer' and the 'grinder' method, are described in this report. 16 refs, 10 figs, 6 tabs

6257 (NUTEK-FJV–94-6, pp. 1-43 (paper III)) **Thermal conductivity of gaseous mixtures in foams. An evaluation of existing methods.** Wan, P. (Division of Heat and Power Technology, Chalmers University of Technology, Gothenburg (Sweden)); Vamling, L. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

Also published by Chalmers Univ. of Technology, Div. of Building Technology as Publ 94:1.

In this report, an evaluation of the existing calculation methods and a literature survey on the thermal conductivity of several insulating gas mixtures at atmospheric pressure were performed in the temperature range of 273K to 373K. The gases of primary interest were R11, R142b, CO_2, and air (N_2/O_2). The experimental thermal conductivities for the mixtures of CO_2/N_2, CO_2/air and $R11/N_2$ were compared with the estimated thermal conductivities calculated using three different methods. These methods were the one by Wassiljewa with Mason and Saxena modification, the one by Chung et al and a linear average of the thermal conductivity of the pure substances. From the comparison, the deviation was found to be, on average, less than 4%, except for the linear average of $R11/N_2$ mixture. The thermal conductivities of mixtures, $R11/CO_2/N_2/O_2$ and $R141b/CO_2/N_2/O_2$, were calculated using concentrations typical of aging foams. Three different methods were used and the percent deviation among these methods could be as much as 10%. The Wassiljewa equation is recommended for the calculation of the thermal conductivity of mixtures but more experimental data are needed in order to draw a more definitive conclusion. 21 refs, 9 figs, 10 tabs

6258 (NUTEK-FJV–94-6, pp. 1-20 (paper V)) **A symmetrical sample arrangement for accurate creep measurements on rigid PUR foams at elevated temperatures.** Bergstroem, G. (Swedish National Testing and Research Institute, Gothenburg (Sweden)); Karlsson, Jonas. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

Also published by Chalmers Univ. of Technology, Div. of Building Technology as Publ 94:1.

A symmetrical sample arrangement has been used to facilitate accurate measurement of the creep behaviour of closed cell PUR foams at elevated temperatures. Partly modelling the actual PUR foam boundary conditions in a district heating pipe, the symmetry of the measurement set-up balances dimensional changes caused by thermal expansion of the PUR structure and by changes in cell gas pressure. The rise in temperature causes the gas pressure in the closed cells to increase, and at the same time the changes in gas pressure accelerate due to higher gas diffusion rates. By applying the mechanical load on a symmetry plane, the zero point for creep measurement is stabilised by a factor of 10, and creep deformation can be measured virtually independently of changes in internal pressure. The measuring procedure produces elevated temperature data which do not suffer from the ambiguity of conventional TMA measurements. The creep properties of different PUR foam materials can therefore be compared directly irrespective of gas types etc. The measuring set-up described was successfully used on two reference PUR foams, FEBIS I (CFC blown) and FEBIS II (CO_2 blown). At a load of 50 kPa, the creep behaviour has been studied in the temperature range 23 degrees C - 170 degrees C over loading periods of up to 2000 hours. 4 refs, 14 figs

6259 (NUTEK-FJV–94-6, pp. 1-16 (paper VI)) **The load bearing capacity of CFC-free pre insulated district heating pipes at service temperature. Test method for determination of the axial shear strength of heating mains.** Jarfelt, U. (Division of Building Technology, Chalmers University of Technology, Gothenburg (Sweden)); Bergstroem, G.; Karlsson, Jonas. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

Also published by Chalmers Univ. of Technology, Div. of Building Technology as Publ 94:1.

The aim of the project was to develop test equipment for the determination of the axial shear strength of pre-insulated district heating pipes at service temperature. The test equipment complies with the requirements in EN 253, Rev. 5, where the service pipe temperature is maintained at 140 $\pm$ 2 degrees C. This temperature is reached within 30 minutes and is maintained for 30 minutes before the test load is applied. The axial shear strength of a number of pipe samples with CFC-blown, HCFC-blown and CO_2-blown foams has been determined at both room temperature, 23 degrees C, and service temperature, 140 degrees C. Non-aged and aged pipes (aged in accordance with EN 253, i.e. 170 degrees C for 1450 hours) were also tested. Pipes of the following makes were tested: Ecopipe, I.C. Moeller, Loegstoer, Powerpipe, Stjaernroer and Tarco. The measurements were made in short series, and comparisons between the different materials must therefore be made with care. The results indicate, however, that the axial shear strength of the CFC-free pipes is at the same level as that of traditional pipes. 2 refs, 6 figs

6260 (NUTEK-FJV–94-6, pp. 1-23 (paper VII)) **The load bearing capacity of CFC-free pre-insulated district heating pipes at service temperature. Creep due to radial compressive loading.** Jarfelt, U. (Division of Building Technology, Chalmers University of Technology, Gothenburg (Sweden)); Bergstroem, G.; Karlsson, Jonas. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. Project NUTEK-656-101. In *CFC-free polyurethane foam.* 204p. Order Number DE95723995. Source: OSTI; NTIS.

Also published by Chalmers Univ. of Technology, Div. of Building Technology as Publ 94:1.

The aim of this project has been to investigate the creep behaviour at service temperatures of rigid polyurethane foam for district heating mains. Measuring apparatus and a test method have been developed for the determination of radial compressive creep under controlled conditions. The project was financed by the Swedish District Heating Association and the Swedish Board for Industrial and Technical Development, NUTEK, and was carried out as a joint venture between Chalmers University of Technology, Gothenburg, Sweden, and the Swedish National Testing and Research Institute, Gothenburg, Sweden. The investigation took as a point of departure the existing standardised procedures for measurement of compressive creep, DIN 53425 (1965) and ISO 7860 (1986). These procedures have been modified in several respects to take account of problems due to high gas diffusion rates in the temperature range concerned, 100-140 degrees C. In order to understand and interpret the different test methods regarding softening temperature and radial creep, TMA measurements are compared with these creep measurements. The procedure developed has been used for measurements on CO_2-blown and CFC 11-blown polyurethane foams at 23, 120, 130 and 140 degrees C. The object was to gain experience of the procedure and to get an indication of the creep properties of the two materials. Since only two materials were tested, no general conclusions can be drawn, but results so far indicate only minor differences in creep behaviour.

Substantial differences were noted relative to TMA measurements. The results given by these are highly influenced by the measuring situation and shall not be interpreted as measurements of polyurethane material properties. 7 refs, 13 figs

6261 (ORNL/FMP–94/1, pp. 137-143) **Activation and micropore structure determination of carbon-fiber composite molecular sieves.** Derbyshire, F. (Univ. of Kentucky, Lexington, KY (United States)); Fei, Y.Q.; Jagtoyen, M.; Kimber, G.; Matheney, M.; Burchell, T. Oak Ridge National Lab., TN (United States). Aug 1994. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

Carbon fibers are produced commercially from rayon, phenolics, polyacrylonitrile (PAN), or pitch. The last are further divided into fibers produced from isotropic pitch precursors, and those derived from pitch that has been pretreated to introduce a high concentration of carbonaceous mesophase. Over the past few decades, interest in research and manufacturing carbon fibers has overwhelmingly centered on producing fibers with high tensile strength and high modulus for lightweight, high performance composites, where polymers, metals, and carbon can form the continuous matrix. The fibers most commonly used in advanced materials are produced from PAN or mesophase pitch. Graphitized mesophase pitch fibers tend to have higher modulus and lower tensile strength than the PAN-based equivalents. They have advantages in applications requiring high stiffness, high electrical and thermal conductivity, low thermal expansion, and high temperature oxidation resistance, while PAN fibers are employed where high strength is required.

6262 (UCRL-ID–112775, pp. 6.1-6.5) **Processing and characterization of laminated metal composites.** Syn, C.K.; Lesuer, D.R.; Sherby, O.D. Lawrence Livermore National Lab., CA (United States). Mar 1993. In *Materials Science and Engineering.* 30p. Order Number DE94003018. Source: OSTI; NTIS; GPO Dep.

In this work, the authors have made laminated metal composites of (1) ultrahigh carbon steel (1.8% C) and brass (70% Cu-30% Zn), and (2) Al 5182 and Al 6061-25 vol% SiC_p. The laminates were prepared by hot pressing alternating layers of the component materials in an argon gas atmosphere. Tensile and fracture toughness were measured for different processing conditions of surface oxide descaling, layer thickness, and heat treatment. Descaling of the surface oxide prior to the press bonding was found to eliminate premature delamination along interfaces, resulting in an increased yield strength and tensile ductility. Reduction in the layer thickness brought a large increase in tensile ductility, and a small decrease in yield strength and fracture toughness. T6 heat treatment on the Al laminates induced a substantial increase in the yield and tensile strength, but a decrease in tensile ductility. Fracture toughness measured both in the crack-arrester and crack-divider orientations showed a large enhancement over that of the component materials. Damping capacity measurements also showed rather remarkable increases over that of the component materials. 10 refs., 4 figs., 1 tab.

6263 (UCRL-ID–112775, pp. 6.17-6.21) **Fiber-optic Raman spectroscopy for cure monitoring of advanced polymer composites.** Lyon, R.E.; Myrick, M.L.; Vess, T.M.; Angel, S.M. Lawrence Livermore National Lab., CA (United States). Mar 1993. In *Materials Science and Engineering.* 30p. Order Number DE94003018. Source: OSTI; NTIS; GPO Dep.

The curing reaction of an epoxy resin matrix that is used for wet-filament-wound composites was monitored using Raman spectroscopy measured over fiber optics. The resin system consists of the diglycidyl ether of bisphenol-A in combination with a polyethertriamine hardener in a 1:1 stoichiometric ratio. The extent of chemical reaction of the epoxy as a function of time was measurable through changes in peak heights of several vibrational modes. A Raman peak associated with a phenyl ring vibration in the epoxide component was used as an internal reference to correct for density changes and instrumental variations. The feasibility of simultaneous temperature measurements was successfully demonstrated with the same fiber optics used to obtain the cure chemistry data, by measuring the intensity of anti-Stokes Raman scattering from the epoxy. 20 refs., 4 figs.

6264 (WSRC-TR–94-0527) **Stainless steel recycle FY94 progress report.** Imrich, K.J. Westinghouse Savannah River Co., Aiken, SC (United States). 28 Oct 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95003905. Source: OSTI; NTIS; INIS; GPO Dep.

The Materials Technology Section (MTS) of the Savannah River Technology Center (SRTC) was asked to demonstrate the practicality of recycling previously contaminated stainless steel components such as reactor heat exchanger heads, process water piping and slug buckets into 208 liters (55 gallon) drums and 2.8 cubic meter (100 ft^3) storage boxes. Radioactively contaminated stainless steel scrap will be sent to several industrial partners where it will be melted, decontaminated/cast into ingots, and rolled into plate and sheet and fabricated into the drums and boxes. As part of this recycle initiative, MTS was requested to demonstrate that radioactively contaminated Type 304L stainless steel could be remelted and cast to meet the applicable ASTM specification for fabrication of drums and boxes. In addition, MTS was requested to develop the technical basis of melt decontamination and establish practicality of using this approach for value added products. The findings presented in this investigation lead to the following conclusions: recycle of 18 wt% Cr-8 wt% Ni alloy can be achieved by melting Type 304 stainless steel in a air vacuum induction furnace; limited melt decontamination of the contaminated stainless steel was achieved, surface contamination was removed by standard decontamination techniques; carbon uptake in the as-cast ingots resulted from the graphite susceptor used in this experiment and is unavoidable with this furnace configuration. A new furnace optimized for melting stainless steel has been installed and is currently being tested for use in this program.

6265 (CIEMAT–745) **A radiochemical procedure for a low-level measurement of ^{241}Am in environmental samples using a supported functional organo phosphorus extractant.** Gasco, C.; Anton, M.A.; Alvarez, A.; Navarro, N.; Salvador, S. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 56p. (In Spanish). Order Number DE95722439. Source: OSTI; NTIS; INIS.

The transuranides analysis in environmental samples is carried out by CIEMAT using standardized methods based on sequential separation with ionic-exchange resins. The americium fraction is purified through a two-layer ion exchange column and lately in an anion-exchange column in nitric acid methanol medium. The technique is time-consuming and the results are not completely satisfactory (low recovery and loss of alpha-resolution) for some samples. The chemical compound CMPO (octyl(phenyl).N,N-diisobutyl carbomoylmethyiphosphine oxide) dissolved in TPB (tributyl phosphate) and supported on an inert substrate has been tested directly for ^{241}Am analysis by a large number of laboratories. A new method that combines both procedures has been developed. The details of the improved procedure are described in this paper. The advantages of its application to environmental samples (urine, faeces and sediments) are discussed. The utilization of standard, with americium certified concentrations confirms the reliability of our measurements.

6266 (CONF-940414–6) **Simple chemical assays for presence of S_2F_{10} in decomposed SF_6.** Griffin, G.D.; Baker, M.R.; Sauers, I. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international symposium on

gaseous dielectrics; Knoxville, TN (United States); 24-28 Apr 1994. Order Number DE95001423. Source: OSTI; NTIS; GPO Dep.

Disulfur decafluoride (S_2F_{10}; also referred to as sulfur pentafluoride) is a highly toxic gas which can be produced by electrical discharges in SF_6. It would be very useful, both for safety in handling decomposed SF_6 and for diagnosis of fault conditions, to have a convenient, rapid and sensitive field assay for the presence of S_2F_{10}. A number of different assays for S_2F_{10} with varying levels of sensitivity have been developed in the course of a CRADA initiative "Investigation of S_2F_{10} Production and Mitigation in Compressed SF_6-Insulated power Systems." These techniques include GC-MS, cryogenic GC enrichment and IR absorption. Although all of these procedures have been shown to have utility in detecting S_2F_{10}, and some have great sensitivity, they do not, in general, lend themselves to rapid field analyses. Ideally, one might wish to have an assay modeled after the "Draeger Tubes," where a gas sample is drawn through some chemical compound, and the resulting color change can be used to quantify the gas of interest. Disulfur decafluoride had been rather extensively studied in World War II as a candidate chemical warfare agent, and along with biological studies of its toxicity, chemical detection techniques had also been developed. Of the chemical assays described, two were particularly promising, one involving reaction of S_2F_{10} with NaI to produce free I_2 which could be titrated with sodium thiosulfate, and the other involving reaction of S_2F_{10} with p-phenylenediamine to produce a pink/red color. This second assay appeared to hold some promise, and accordingly, experiments were carried out to see if this assay could be useful for detecting S_2F_{10} in electrically decomposed SF_6 samples.

6267 (DOE/EM–0089T-Rev.2) **DOE methods for evaluating environmental and waste management samples.** Goheen, S.C.; McCulloch, M.; Thomas, B.L.; Riley, R.G.; Sklarew, D.S.; Mong, G.M.; Fadeff, S.K. (eds.). Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 835p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–7722-Rev.2). Order Number DE95004428. Source: OSTI; NTIS; INIS; GPO Dep.

DOE Methods for Evaluating Environmental and Waste Management Samples (DOE Methods) is a resource intended to support sampling and analytical activities for the evaluation of environmental and waste management samples from U.S. Department of Energy (DOE) sites. DOE Methods is the result of extensive cooperation from all DOE analytical laboratories. All of these laboratories have contributed key information and provided technical reviews as well as significant moral support leading to the success of this document. DOE Methods is designed to encompass methods for collecting representative samples and for determining the radioisotope activity and organic and inorganic composition of a sample. These determinations will aid in defining the type and breadth of contamination and thus determine the extent of environmental restoration or waste management actions needed, as defined by the DOE, the U.S. Environmental Protection Agency, or others. The development of DOE Methods is supported by the Analytical Services Division of DOE. Unique methods or methods consolidated from similar procedures in the DOE Procedures Database are selected for potential inclusion in this document. Initial selection is based largely on DOE needs and procedure applicability and completeness. Methods appearing in this document are one of two types, "Draft" or "Verified". "Draft" methods that have been reviewed internally and show potential for eventual verification are included in this document, but they have not been reviewed externally, and their precision and bias may not be known. "Verified" methods in DOE Methods have been reviewed by volunteers from various DOE sites and private corporations. These methods have delineated measures of precision and accuracy.

6268 (ETDE/DE-mf–95733294) **Contribution to improvements in the analysis of extremely small trace amounts of platinum metals in biotic and ecologically relevant materials. Follow-up project. Final report.** Institut fuer Spektrochemie und Angewandte Spektroskopie (ISAS), Dortmund (Germany). 1993. 113p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 07VPT01A. Order Number DE95733294. Source: OSTI; NTIS (US Sales Only).

Different decomposition processes for the determination of platinum (adsorptive voltammetry, graphite furnace atomic absorption spectrometry) in biotic and ecologically relevant materials were tested. High-pressure decomposition in quartz vessels (max. 320 C and 130 bar) proved suitable for most sample types whereas open processes can only be recommended for single materials and small sample amounts. Radiochemical tracer-methods were used for testing decomposition, separation and concentration processes for determination of trace amounts of platinum. Studies were performed on ionic chromatographic methods, in particular on electrochemical detection. In-depth research was done into platinum species analysis for the example of grass samples that were either uncontaminated or contaminated with platinum. Platinum levels were determined in various biotic and ecologically relevant materials (uncontaminated and contaminated), especially in body fluids, air-borne particles, soils, fuels, water. (orig.)

6269 (ETDE/DE-mf–95733337) **Environment survey. Vol. 4a. Cadmium.** WaBoLu-Hefte, v. 2/1993. Schwarz, E.; Chutsch, M.; Krause, C.; Schulz, C.; Thefeld, W. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Wasser-, Boden- und Lufthygiene. 1993. 190p. (In German). Sponsored by Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). Project Number UFOPLAN 11606057. Order Number DE95733337. Source: OSTI; NTIS (US Sales Only).

As part of the study 'Measurement and Analysis of Environmental Exposure Factors in the Federal Republic of Germany 1985/86 - Environment and Health', a representative sample of the population of the Federal Republic of Germany at that time aged 25 to 69 years was examined and interviewed. The most important elements of the survey were sampling of blood, urine and hair from the subjects, of dust and drinking water from their households, a questionnaire on 'Environment and Health' and another questionnaire with preferential orientation to 'Life and Health'. This study has demonstrated a number of joint characteristics for the cadmium concentrations in blood and urine. Cadmium in blood expresses above all the current cadmium burden while a chronic cadmium burden has only a minor influence on the cadmium level in blood. Cadmium in urine is above all an indicator of the total body burden from cadmium while the current burden is less readily recognizable from this parameter. However, attention should be given to the considerable influences of metabolic processes on the cadmium level in urine. Under normal conditions of exposure, the cadmium content of hair is unsuitable as an indicator; thus, it should not be used for evaluation instead of the cadmium levels in blood or urine. (orig./EF)

6270 (INIS-mf–14412, pp. 87-88) **Multivariate calibration and quantitation using artificial neutral networks.** Kierzek, J. (Institute of Nuclear Chemistry and Technology, Warsaw (Poland)); Malozewska-Bucko, B.; Kierzek, A. Institute of Nuclear Chemistry and Technology, Warsaw (Poland). [1994]. 118p. In *Annual report 1993*. Order Number DE95608338. Source: OSTI; NTIS; INIS.

Short communication. 9 refs., 3 figs., 1 tab. X-RAY FLUORESCENCE ANALYSIS/calibration; X-RAY FLUORESCENCE ANALYSIS/neural networks; POLYMETALLIC ORES; QUANTITATIVE CHEMICAL ANALYSIS; CALIBRATION

6271 (LA–12874-MS) **Simulation of absorption edge densitometry.** Hsue, Sin-Tao; Collins, M. Los Alamos National Lab., NM (United States). Nov 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95004393. Source: OSTI; NTIS; GPO Dep.

A method for simulating absorption edge densitometry has been developed. This program enables one to simulate spectra containing any combination of special nuclear materials (SNM) in solution. The method has been validated with an analysis method using a single special nuclear material in solution or a combination of two types of SNM separated by a Z of 2. This computer simulation has been used to explore the bias caused by the presence of, for example, plutonium in a determination of uranium concentration. The authors have also used this program to explore better methods of analyzing densitometry data.

6272 (LA-SUB–94-133) **Final report on proposal to develop and test a membrane sampling module for the extraction of volatile organic compounds from water.** Cooks, R.G. (Purdue Univ., West Lafayette, IN (United States). Dept. of Chemistry). Los Alamos National Lab., NM (United States). 29 Jun 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95003459. Source: OSTI; NTIS; GPO Dep.

A new technique is describe for the direct detection of volatile organic compounds in aqueous solutions at levels in the parts per trillion range. The sample is enriched in analyte in two consecutive stages, one utilizes a semi-permeable membrane interface and the other a jet separator. The analyte solution is sampled as it flows coaxially over a semi-permeable capillary membrane, the interior of which is continuously purged by helium. The permeate is pneumatically transported to the mass spectrometer via a jet separator, which is used to remove excess helium and water from the analyte vapor stream. Data are reported for an ion trap mass spectrometer used in conjunction with a conventional fixed-gap quartz jet separator. Typical analyte response times are 2-5 minutes and flow injection methods are used for sample delivery. Detection limits in the range 30 to parts per billion are observed for selected volatile organic compounds and the response is linear over 3 orders of magnitude. Details of the construction of the interface are provided.

6273 (LA-UR–94-1544) **RCRA materials analysis by laser-induced breakdown spectroscopy: Detection limits in soils.** Koskelo, A.; Cremers, D.A. Los Alamos National Lab., NM (United States). [1994]. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE94018613. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of the Technical Task Plan (TTP) that this report supports is research, development, testing and evaluation of a portable analyzer for RCRA and other metals. The instrumentation to be built will be used for field-screening of soils. Data quality is expected to be suitable for this purpose. The data presented in this report were acquired to demonstrate the detection limits for laser-induced breakdown spectroscopy (LIBS) of soils using instrument parameters suitable for fieldable instrumentation. The data are not expected to be the best achievable with the high pulse energies available in laboratory lasers. The report presents work to date on the detection limits for several elements in soils using LIBS. The elements targeted in the Technical Task Plan are antimony, arsenic, beryllium, cadmium, chromium, lead, selenium, and zirconium. Data for these elements are presented in this report. Also included are other data of interest to potential customers for the portable LIBS apparatus. These data are for barium, mercury, cesium and strontium. Data for uranium and thorium will be acquired during the tasks geared toward mixed waste characterization.

6274 (ORNL/FMP–94/1, pp. 63-70) **Carbon fiber composite molecular sieves.** Burchell, T.D. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Aug 1994. DOE Contract AC05-84OR21400. (CONF-9405143–: 8. annual conference on fossil energy materials, Oak Ridge, TN (United States), 10-12 May 1994). In *Proceedings of the Eighth Annual Conference on Fossil Energy Materials.* 451p. Order Number DE95001055. Source: OSTI; NTIS; GPO Dep.

The separation of gases is widely effected via the Pressure Swing Adsorption process. Here we report the synthesis and characterization of a novel adsorbent carbon materials called Carbon Fiber Composite Molecular Sieve. The unique combination of properties exhibited by this material makes it ideal for application in Pressure Swing Adsorption Systems, where its utilization will result in significant gains in process economics.

6275 (ORNL/TM–12785) **Citrate based "TALSPEAK" lanthanide-actinide separation process.** Del Cul, G.D.; Bond, W.D.; Toth, L.M.; Davis, G.D.; Dai, S.; Metcalf, D.H. Oak Ridge National Lab., TN (United States). Sep 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95002059. Source: OSTI; NTIS; INIS; GPO Dep.

The potential hazard posed to future generations by long-lived radionuclides such as the transuranic elements (TRU) is perceived as a major problem associated with the use of nuclear power. TRU wastes have to remain isolated from the environment for "geological" periods of time. The costs of building, maintaining, and operating a "geological TRU repository" can be very high. Therefore, there are significant economical advantages in segregating the relatively low volume of TRU wastes from other nuclear wastes. The chemical behavior of lanthanides and actinides, 4f and 5f elements respectively, is rather similar. As a consequence, the separation of these two groups is difficult. The "TALSPEAK" process (Trivalent Actinide Lanthanide Separations by Phosphorus-reagent Extraction from Aqueous Complexes) is one of the few means available to separate the trivalent actinides from the lanthanides. The method is based on the preferential complexation of the trivalent actinides by an aminopolyacetic acid. Cold experiments showed that by using citric acid the deleterious effects produced by impurities such as zirconium are greatly reduced.

6276 (SAND–94-2817C) **Chemical recognition software.** Wagner, J.S.; Trahan, M.W.; Nelson, W.E.; Hargis, P.J. Jr.; Tisone, G.C. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9411144–3: Optical sensing for environmental and process monitoring, McLean, VA (United States), 7-10 Nov 1994). Order Number DE95003346. Source: OSTI; NTIS; GPO Dep.

We have developed a capability to make real time concentration measurements of individual chemicals in a complex mixture using a multispectral laser remote sensing system. Our chemical recognition and analysis software consists of three parts: (1) a rigorous multivariate analysis package for quantitative concentration and uncertainty estimates, (2) a genetic optimizer which customizes and tailors the multivariate algorithm for a particular application, and (3) an intelligent neural net chemical filter which pre-selects from the chemical database to find the appropriate candidate chemicals for quantitative analyses by the multivariate algorithms, as well as providing a quick-look concentration estimate and consistency check. Detailed simulations using both laboratory fluorescence data and computer synthesized spectra indicate that our software can make accurate concentration estimates from complex multicomponent mixtures even when the mixture is noisy and contaminated with unknowns.

6277 (WHC-EP–0822) **Assessment report for Hanford analytical services quality assurance plan.** Taylor, L.H. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 293p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003994. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the assessment results of DOE/RL-94-55, Hanford Analytical Services Quality Assurance Plan. The assessment was conducted using the Requirement and Self-Assessment Database (RSAD), which contains mandatory and nonmandatory DOE Order statements for the relevant DOE orders.

6278 (WHC-SD-WM-DP–068) **Concrete samples for organic samples, data package and 222-S validation summary report. Addendum 1A.** Vogel, R.E. Westinghouse Hanford Co., Richland, WA (United States). 1 Nov 1994. 559p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (WHC-SD-WM-DP–068-Add.1A). Order Number DE95003075. Source: OSTI; NTIS; INIS; GPO Dep.

This document is in two parts: the first is the data package entitled "Concrete Samples for Organic Samples" and the second is entitled "Concrete Samples for Organic Samples – Addendum 1A" which is the 222-S validation summary report.

6279 (DOE/ER/13296–11) **The transformation of organic amines by transition metal cluster compounds: Progress report.** Adams, R.D. South Carolina Univ., Columbia, SC (United States). Dept. of Chemistry. Nov 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-84ER13296. Order Number DE95004180. Source: OSTI; NTIS; GPO Dep.

Research during the current award period has covered several related topics which have emerged and grown as a consequence of the various discoveries that have been made during this award period. They have been divided into the following subsections for clarity and emphasis: The activation of tertiary amines by osmium cluster complexes; CH bond activation and ring opening of a nitrogen containing strained ring heterocycle by an osmium cluster complex; Ring opening of cyclic thioethers; cyclooligomerization of Thietanes; Studies of the cyclobutyne ligand; Insertion of an alkynes into metal-metal bonds; and Energy storage in metal clusters. A summary of the results of these studies is given in the following sections of this report. These studies have resulted in 50 scientific publications over the last three years and details of their studies beyond that given in the following sections can be found in those reports. All of these reports are listed in the final section of this report by the author's names, title and journal citation.

6280 (DOE/ER/13406–9) **Organometallic chemistry of bimetallic compounds. Progress report, January 1992–July 1995.** Casey, C.P. Wisconsin Univ., Madison, WI (United States). Jul 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13406. Order Number DE95004436. Source: OSTI; NTIS; INIS; GPO Dep.

Four main projects at the interface between organometallic chemistry and homogeneous catalysis were pursued. All were designed to give increased understanding of the mechanisms of organometallic reactions related to homogeneous and heterogeneous catalysis. In addition, a minor study involving η^5-to η^1-cyclopentadienyl ring slippage in catalysis was completed.

6281 (DOE/ER/13775–6) **Group transfer and electron transfer reactions of organometallic complexes.** Atwood, J.D. State Univ. of New York, Buffalo, NY (United States). Dept. of Chemistry. [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13775. Order Number DE95003732. Source: OSTI; NTIS; GPO Dep.

During 1994, despite the disruptions, the authors have made progress in several aspects of their research on electron transfer reactions between organometallic complexes. This summary covers three areas that are relatively complete: (1) reactions between metal carbonyl anions and metal carbonyl halides, (2) reactions of hydrido- and alkyl-containing anions ($RFe(CO)^-_4$ and $RW(CO)_5^-$) with metal carbonyl cations and (3) reactions of a seventeen-electron complex ($Cp_*Cr(CO)_3\bullet$) with metal carbonyl derivatives. Two areas of examination that have just begun (possible carbene transfer and the possible role of metal carbonyl anions in carbon-hydrogen bond activation) will also be described.

6282 (DOE/ER/13811–2) **Potential energy surfaces for chemical reactions. Progress report, March 15, 1988–1989.** Schaefer, H.F. III. Georgia Univ., Athens, GA (United States). Center for Computational Quantum Chemistry. [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87ER13811. Order Number DE95004551. Source: OSTI; NTIS; GPO Dep.

The crystal structure of two esters, both coupled bicyclo[1.1.0] butane derivatives, are found to have extremely short carbon-carbon central bonds (1.440-1.445 angstroms). The phenomena is tested by quantum mechanical methods since chemical experiments are not currently possible. Theoretical models employed were the minimum basis set (MBS), the standard double zeta(DZ), the double zeta plus d(DZ+d), the double zeta plus polarization(DZ+P), along with the self-consistent field method provide predictions for intra-cyclic bond lengths and angles including the central bond length.

6283 (DOE/ER/14254–2) **Carbons and hydrogen by persistent metal radicals. Final report, April 1, 1993–October 31, 1994.** Department of Energy, Washington, DC (United States). Div. of Chemical Sciences. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER14254. Order Number DE95003834. Source: OSTI; NTIS; GPO Dep.

The synthesis of complexed rhenium radicals is demonstrated from the reaction of sterically demanding phosphine with the triphenylmethyl complex $[\eta^5\text{-}CPh_3]Re(CO)_3$. Low yields are experienced unless high concentrations of phosphine ligands are employed with the mechanism of this reaction yet unknown. A complexed rhenium dimer is also synthesized, but in low yield. X-ray crystallography reveals that the sixth coordination site of the electron deficient rhenium cation (an extremely strong Lewis acid) is occupied by an agostic interaction with one of the pendant C-H bonds of the cyclohexyl ring of the complex. Preliminary results show that the rhenium complexes have a significantly different chemistry from similar tungsten analogs in reactivity and isotope exchange rates. It is hypothesized that the rhenium complexes would be useful in catalyzing the isotope exchange between water and hydrogen.

6284 (DOE/PC/93222–4) **NO decomposition in non-reducing atmospheres. Technical progress report, June 1994–August 1994.** Klier, K.; Herman, R.G.; Jirka, I. Lehigh Univ., Bethlehem, PA (United States). Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93222. Order Number DE95004324. Source: OSTI; NTIS; GPO Dep.

This report summarizes the results obtained during optimization of conditions of ion exchange of Co^{2+} cations into zeolite A. The results are summarized as follows: The Co^{2+} species were introduced into Na A zeolite by contacting the zeolite with aqueous solution of cobalt (11) nitrate at pH ~6 and pH ~11. In both cases the expected ion exchange stoichiometry 1 Co^{2+}:2 Na^{1+} was exceeded, indicating intracavital precipitation and precipitation extraneous to the zeolite grains of excess cobalt species which likely consist of hydroxyoxides. All cobalt appeared to be divalent. Distribution of the Co^{2+} species was initially uniform in the preparation carried out at pH 6 but prolonged heat treatment resulted in the enrichment of cobalt in the external surface region of the zeolite. At pH 11, the initial distribution was nonuniform, with the Co^{2+} species enriched at the surface. The preparation did not achieve the intended exchange stoichiometry and indicated rather that more or less undefined cobalt (11) hydroxyoxide supported by the zeolite material, which could also be partially exchanged with cobalt, has been produced. Because in the catalytic applications reproducibility is essential, further preparations aiming at the desired exchange stoichiometry have been initiated in which lower pH will prevent precipitation of the hydroxyoxides. However, all the samples will be tested for NO decomposition to obtain a qualitative comparison between ion-exchanged and impregnated CoNaA zeolites.

6285 (LA-UR–94-3803) **Base hydrolysis and supercritical water oxidation of PBX-9404.** Flesner, R.L.; Spontarelli, T.; Dell'Orco, P.C.; Kramer, J.F.; Sanchez, J.A. Los Alamos National Lab., NM (United States). 9 Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411155–1: 1994 Luxembourg international symposium on the rehabilitation of military sites and demilitarization of explosive ordance, Kirchberg (Luxembourg), 14-18 Nov 1994). Order Number DE95003685. Source: OSTI; NTIS; GPO Dep.

Base hydrolysis in combination with hydrothermal processing has been proposed as an environmentally acceptable alternative to open burning/open detonation for degradation and destruction of high explosives. In this report, the authors examine gaseous and aqueous products of base hydrolysis of the HMX-based plastic bonded explosive, PBX-9404. The authors also examine products from the subsequent hydrothermal treatment of the base hydrolysate. The gases produced from hydrolysis of PBX-9404 are ammonia, nitrous oxide, and nitrogen. Major aqueous products are sodium formate, acetate, nitrate, and nitrite, but not all carbon products have been identified. Hydrothermal processing of base hydrolysate destroyed up to 98% of the organic carbon in solution, and higher destruction efficiencies are possible. Major gas products detected from hydrothermal processing were nitrogen and nitrous oxide.

6286 (LA-UR–94-3999) **Reflectivity studies on adsorbed block copolymers under shear.** Smith, G.S. (Los Alamos National Lab., NM (United States)); Wages, S.; Baker, S.M.; Toprakcioglu, C.; Hadziioannou, G. Los Alamos National Lab., NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–12: 1994 fall meeting of the Materials Research Society

(MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003676. Source: OSTI; NTIS; GPO Dep.

The authors report neutron reflectivity data on (poly)styrene-(poly)ethylene oxide (PS-PEO) diblock copolymers adsorbed onto quartz from the selective solvent cyclohexane (a non-solvent for PEO and a poor solvent for PS). The PEO "anchor block" adsorbs strongly to form a thin layer on the quartz substrate, while the deuterated PS chains dangle into the solvent. They find that under static conditions the density profile of the PS block in a poor solvent can be well described by a Schultz function which is indicative of a polymer "mushroom." Furthermore, they have studied the same system under shear at shear rates from 0–400s^{-1}. They find that there is a dramatic increase in the thickness of the PS layer under shear in cyclohexane and that the relaxation time from the shear-on profile back to the static profile is on the order of several days.

6287 (PSI–94-18) **Modelling of the near-field chemistry of the SMA repository at the Wellenberg site.** Neall, F.B. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. 83p. Order Number DE95610661. Source: OSTI; NTIS; INIS.

Of the materials which make up the L/ILW repository for short-lived low- and intermediate-level wastes, around 95 weight percent consists of concrete, around 4% of steel and around 1% of high molecular weight organic waste components. In this report, models are used to evaluate the long-term stability of concrete, steel and high molecular weight organic components under repository conditions. The results of this study will then form the basis for describing release of radionuclides from the disposal caverns, and particularly the sorption of nuclides on concrete. In the disposal caverns, concrete is exposed to a range of processes which affect its stability. External processes include the leaching of hydrated cement by percolating groundwater, while internal processes include dissolution of repository components in cement porewater which can then react with the concrete. Of greatest significance in this respect are the high molecular weight organic waste components which degrade to organic acids in the disposal environment and then react with the basic components of the concrete. The leaching of hydrated cement is described, using a mixing tank model, as a sequence of batch experiments in which the same cement block reacts repeatedly with fresh groundwater. The model is based on the work by Berner (1990) but has been extended to include other solid cement phases and can, in a simple way, take account of the degradation of high molecular weight organics and their reaction with hydrated cement. The mixing tank model shows that, given the low water fluxes that are expected for a L/ILW repository, concrete remains stable over geological time spans provided only small volumes of high molecular organics are present. If high concentrations of these materials ar present, the longevity of the concrete may be reduced. (author) figs., tabs., refs.

6288 (PSI–94-19) **Physico-chemical characterisation and calculated in situ porewater chemistries for a low permeability Palfris marl sample from Wellenberg.** Baeyens, B. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Bradbury, M.H. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Nov 1994. 33p. Order Number DE95610662. Source: OSTI; NTIS; INIS.

Wellenberg (Gemeinde Wolfenschiessen, NW) has been chosen by Nagra as a repository site for short lived low- and medium-level radioactive waste. In certain regions of this Palfris marl formation, foreseen as actual locations for the repository, the water flow rates are so low that reliable water samples for chemical analysis were not obtainable. A sample of Palfris marl was provided from such a region and a physico-chemical characterisation technique, developed and tested in previous work, was applied. The measurements, coupled with a geochemical modelling study, yielded a NaCl type porewater with an ionic strength of $\simeq$0.12 M. In addition, a matrix marl porosity of $\simeq$1.5% was deduced using the chloride concentrations in the calculated porewater and measurements on the chloride content of marl. 6289 (DOE/ER/45292–15) **NMR and optical studies of piezoelectric polymers. Final performance report, April 1, 1993–March 31, 1994.** Schmidt, V.H.; Tuthill, G.F. Montana State Univ., Bozeman, MT (United States). Dept. of Physics. [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-87ER45292. Order Number DE95003836. Source: OSTI; NTIS; GPO Dep.

The piezoelectric liquid crystal mixtures ZLI-2861, E7, and the copolymers of vinylidene fluoride are investigated with a variety of instrumental techniques including optical studies, nuclear magnetic resonance, and neutron scattering/diffraction. A unique AC thermal diffusivity apparatus was built to determine the specific heat and thermal conductivity of the liquid crystals. Included is an elastic and surface hypothesis for droplets of the liquid crystals. Statistical mechanics, such as the Monte Carlo method, determined that the electrically active polymers showed no percolation transition and that electrical forces play a dominant role in determining chain conformations. A molecular dynamics simulation of PVF_2 studied vibration spectrum, relaxation, and response to a switching field.

The theoretical model of exhaust gases radiation induced oxidation was developed. NO, SO_2, H_2S concentration curves vs. dose calculated by the use of this model for mixtures containing N_2 (80.5%), O_2 (11%), H_2O (8.4%), NO (100-600 ppm), SO_2 (150-500 ppm), H_2S (300-1000 ppm) have been obtained. It was been shown that NO and SO_2 conversion reactions with acids formation go simultaneously with oxidizing reaction of H_2S giving SO_2 as an intermediate compound. These processes were evaluated for different initial concentrations of NO, SO_2 and H_2S. Data established by our simulation calculations show that the electron beam process can be judged as a promising technology for simultaneous removal of SO_2, NO and H_2S from exhaust gases. 11 refs, 7 figs.

The heterogeneous reactions in droplets and clusters are essential in the evaluation of the chemical composition during plasma cleaning of the gases from SO_2, NO_x and H_2S. Theoretical investigation and the full modelling of SO_2 and NO_x purification in heterogenous non-equilibrium plasma has been presented. The main objective of author's approach modelling was to find the optimum regime of plasma generation (specific power, humidity, etc.) for essential decreasing of the purification energy cost. 24 refs, 6 figs, 1 tab.

It was proposed by Protapkin that the oxidation energy cost can be significantly reduced by using an effect of SO_2 plasma-catalytic oxidation. The new chain gas-cluster oxidation mechanism has been considered. The theoretical investigations as well as experimental results for verification of proposed mechanism have been shown and discussed. 13 refs, 1 fig.

6293 (LA-UR–94-4071) **Cation disorder determined by MAS ^{27}Al NMR in high dose neutron irradiated spinel.** Cooper, E.A. (Los Alamos National Lab., NM (United States)); Sickafus, K.E.; Hughes, C.D.; Earl, W.L.; Hollenberg, G.W.; Garner, F.A.; Bradt, R.C. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–4: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003681. Source: OSTI; NTIS; GPO Dep.

Spinel ($MgAl_2O_4$) single crystals which had been neutron irradiated to high doses (53-250 dpa) were examined using ^{27}Al magic angle spinning (MAS) nuclear magnetic resonance (NMR). The sensitivity of this procedure to a specific cation (Al) residing in different crystallographic environments allowed one to determine the distribution of the Al between the two cation sites in the spinel structure. The samples were irradiated at two different temperatures (400 and 750°C) and various doses. These results indicate that the Al was nearly fully disordered over the two lattice sites after irradiation.

6294 (SLV–17-93) **Detection of irradiated food. Progress report 1989/90-1992/93.** Cerda, H. (Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology); Nilson, Haakan. National Food Administration, Uppsala (Sweden). 20 Oct 1993. 45p. (In Swedish). Order Number DE95610865. Source: OSTI; NTIS; INIS.

In 1990 the Swedish National Food Administration was commissioned by the Ministry of Agriculture to prepare and develop methods of analysis to identify irradiated foods. This work has been done in cooperation with the Department of Radioecology, Swedish University of Agricultural Sciences. Two methods for analyses of irradiated foods have been developed; a chemical method for analysis of products containing fat, and a method for analysis of DNA in cells obtained from foods. Both methods have been tested within the Nordic cooperation programme and the BCR programme (Bureau Communautaire de Reference) organized by the EC. The chemical method for analysis of fats is already an established method that is approved for certain foods by authorities in, for example, Germany. The DNA approach is new and is considered to be a rapid screening method for use in combination with other methods. However, this method requires testing in cooperation with other laboratories before it can be accepted internationally. Laboratories from several countries are already using the method. The two methods described here make it possible to monitor foods such as chicken and duck that have been irradiated due to the risk of salmonella infection. Establishment of wider possibilities to monitor foods will require an additional method. One such method used today for several foods is the thermoluminescence method. This procedure can be used on prawns and other marine fauna, on spices, and possibly also on strawberries and tomatoes. It is an established approach and is used today for controls in most countries. 37 refs, 12 figs, 2 tabs.

(Nuclear Research Center Karlsruhe, Cyclotrone Lab., Karlsruhe (Germany)); Bertram-Berg, A. Argonne National Lab., IL (United States). Jul 1993. (CONF-9209266–: 1992 international meeting on reduced enrichment for research and test reactors, Roskilde (Denmark), 27 Sep - 1 oct 1992). In *Reduced enrichment for research and test reactors: Proceedings.* 376p. Order Number DE94012405. Source: OSTI; NTIS; INIS.

The processing of irradiated MTR-fuels for the production of fission nuclides for nuclear medicine presents a significantly increasing task in the field of chemical separation technology of high activity levels. By far the most required product is MO-99, the mother nuclide of Tc-99m which is used in over 90% of the organ function tests in nuclear medicine. Because of the short half life of Mo-99 (66 h) the separation has to be carried out from shortly cooled neutron irradiated U-targets. The needed product purity, the extremely high radiation level, the presence of fission gases like xenon-133 and of volatile toxic isotopes such as iodine-131 and its compounds in kCi-scale require a sophisticated process technology.

6296 (CIEMAT–734) **Optimization of the synthesis of a high specific activity "125 I-labelled hapten for radioimmunoassays.** Suarez, C.; Simon, M.A.; Paz, D.; Romero del Hombrebueno, B. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 17p. (In Spanish). Order Number DE95721641. Source: OSTI; NTIS; INIS.

In this first report it is described the synthesis, separation and purification of the 2-radioiodinated histamine "125 I-labelled histamine by a mixed anhydride reaction. About 75% incorporation of I"1125, from Na"125, I, was achieved with a molecular ratio of 1:1 mixed anhydride:histamine. The radiochemical purity of the conjugate by TLC was >99% and its theoretical specific activity, 3850 mu Ci/mug. Dissolved in ethanol and held at -20 degree centigree under darkness decomposition on storage did not exceed 1% per month.

When chemical engineers think of chemical processing, they often do not include the US government or the national laboratories as significant participants. Compared to the scale of chemical processing in the chemical process, petrochemical and pharmaceutical industries, the government contribution to chemical processing is not large. However, for the past fifty years, the US government has been, heavily involved in chemical processing of some very specialized materials, in particular, uranium and plutonium for nuclear weapons. Individuals and corporations have paid taxes that, in part have been used to construct and to maintain a series of very expensive laboratories and production facilities throughout the country. Even ignoring the ongoing R & D costs, the price per pound of enriched uranium or of plutonium exceeds that of platinum by a wide margin. Now, with the end of the cold war, the government is decommissioning large numbers of nuclear weapons and cleaning up the legacy of radioactive wastes generated over the last fifty years. It is likely that the costs associated with the build-down and clean-up of the nuclear weapons complex will exceed the investment of the past fifty years of production. Los Alamos National Laboratory occupies a special place in the history of nuclear weapons. The first weapons were designed and assembled at Los Alamos using uranium produced in Oak Ridge, Tennessee or plutonium produced in Richland, Washington. Many of the thermophysical and metallurgical properties of actinide elements have been investigated at Los Alamos. The only plutonium processing facility currently operating in the US is in Los Alamos, and the Laboratory is striving to capture and maintain the uranium processing technology applicable to the post-cold war era. Laboratory researchers are actively involved in developing methods for

cleaning up the wastes associated with production of nuclear weapons throughout the US.

6298 (WHC-SD-CP-TP–079) **Test procedure for anion exchange chromatography.** Cooper, T.D. Westinghouse Hanford Co., Richland, WA (United States). 1 Sep 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003767. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium from stored nitrate solutions will be sorbed onto anion exchange resins and converted to storable plutonium dioxide. Useful information will be simultaneously gained on the thermal stability and ion exchange capacity of four commercially available anion exchange resins over several years and under severe degradative conditions. This information will prove useful in predicting the safe and efficient lifetimes of these resins.

6299 (WHC-SD-CP-TP–080) **Test procedure for cation exchange chromatography.** Cooper, T.D. Westinghouse Hanford Co., Richland, WA (United States). 24 Aug 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003770. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test plan is to demonstrate the synthesis of inorganic antimonate ion exchangers and compare their performance against the standard organic cation exchangers. Of particular interest is the degradation rate of both inorganic and organic cation exchangers. This degradation rate will be tracked by determining the ion exchange capacity and thermal stability as a function of time, radiation dose, and chemical reaction.

6300 (DOE/ID–10456) **Ignition of exploding aluminum droplets behind shock waves in water.** Theofanous, T.G.; Chen, X.; Di Piazza, P. California Univ., Santa Barbara, CA (United States). Center for Risk Studies and Safety. Sep 1994. 29p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003975. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is an experimental study of the ignition of molten aluminum droplets in a well controlled and characterized simulated steam explosion environment. Ignition refers to the rapid oxidation of aluminum by steam, a reaction that can greatly augment the yield of the physical event (steam or thermal explosion). The simulated explosion environment was created in a hydrodynamic shock tube capable of producing sustained pressure pulses (2 ms duration) of amplitudes up to 50 MPa. The behavior of gram-quantities of molten aluminum droplets was studied as a function of their temperature in the 800°C (1073 K) to 1700°C (1973 K) range, and shock pressure, in the 6.8 to 40.8 MPa range. With the help of the resulting debris the authors have identified three main regimes of interaction: a "chemical" one where 100% of the melt has been converted to finely pulverized (micron size) α-$A\ell_2O_3$ and γ-$A\ell_2O_3$; a "partially-chemical" one where only some fraction (10 to 40%) of the debris met the above "chemical" characterization; and a "physical" regime where no "fines" or significant chemical oxidation of the melt was discernible. The work performed here involves extension of the working temperature range for shock tube research at UCSB to 1700°C and a breakthrough in demonstrating the effects of chemical reactions on the thermal interactions which had been the focus of fuel-coolant interaction (FCI) research.

6301 (ETDE/DE-mf–95733381) **Formation and behaviour of halogenated dibenzodioxins and dibenzofurans in thermal processes.** Zier, B. Technische Univ. Muenchen, Freising (Germany). Fakultaet fuer Landwirtschaft und Gartenbau. 2 Oct 1992. 117p. (In German). Order Number DE95733381. Source: OSTI; NTIS (US Sales Only).

The dissertation investigates the formation of halogenated dibenzodioxing and dibenzofurans in thermal processes. Bromine compounds are added to plastics as inflammation protection agents in concentrations of 5-20% by weight. A method of analysis was developed by which PBDD and PBDF of all degrees of bromination as well as PBCDD/PBCDF and PCDD/PCDF could be detected with high accuracy and sensitivity. Combustion experiments with different plastics showed that polybrominated diphenyl ethers have the most pronounced tendency to form PBDD and especially PBDF. Between 0.2% and 1% PBDF are produced independent of the degree of bromination of the ether. (BBR)

6302 (KFK–5274) **Formation of organic compounds at the reaction of toluene with fly ash in liquid and vapour phase.** Mandl, B. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Heisse Chemie; Heidelberg Univ. (Germany). Naturwissenschaftlich-Mathematische Gesamtfakultaet. May 1994. 195p. (In German). Order Number DE95731715. Source: OSTI; NTIS (US Sales Only).

Knowledge of reactions and reaction mechanisms of fly ash from municipal waste incineration plants leading to formation of organic compounds, is very important for minimizing the emission of these substances. Studying the reaction of toluene with fly ash is a contribution to this. During this reaction in liquid phase ($T \leq 111$ C), it could be shown that o- and p-methyldiphenylmethane were formed. This dimerisation of toluene describes the first step of an oxidation or condensation reaction, and their rate constant and activation energy were determined. Formally the reaction corresponds to zero order as often found in photochemical and catalytic reactions of metallic salts. Further following reactions forming oxidation or condensation products of the MDPMs could not be found in liquid phase. Parallel reactions such as chlorination of toluene up to the boiling point for example were not observed. Comprehensive thermodynamic evaluations in the suitable temperature range showed that the formation of following products is thermodynamically favoured. The different mineral phases of iron and copper are of special interest for chlorination of fly ash. Usually their chlorides are used as chlorinating agents at reactions with fly ash. It could be shown that these metallic salts are not available as water-soluble compounts. After dimerisation further following reactions have been observed in the vapour phase. In the presence of oxygen, oxidation products are formed and condensation products under inert gas atmosphere. In the decomposition of residual carbon of fly ash from 250 C on, addition of toluene to the vapour phase (80% N_2, 20% O_2) increased the formation of chlorinated aromatic compounds. Especially the lower chlorine stages have been preferred at the formation of dioxines and furanes. Thus fly ash is showing a potential of chlorination favouring the formation of organohalogen compounds in a gas-solid-phase (Abstract Truncated).

6303 (NEI-NO–464) **Mathematical modeling and numerical simulation of chemical kinetics in turbulent combustion.** Gran, I.R. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. May 1994. 229p. Order Number DE95723940. Source: OSTI; NTIS.

This thesis analyses turbulent reacting flows with emphasis on the interaction between the turbulence and the chemistry. First, the fundamental equations which govern laminar and turbulent reacting flows are presented. Three alternatives for representing the chemistry in turbulent combustion are studied. The simplest alternative is to assume fast chemistry. Detailed reaction mechanisms give a more accurate description of the chemistry, but are computationally expensive to use. The intrinsic low-dimensional manifold (ILDM) method for reducing the chemistry is an approach for obtaining an accurate representation of the chemistry at less computational effort. In order to be of practical use for turbulent flows, a statistical treatment of the governing equations is necessary. The outcome of such a treatment is either a set of transport equations for the probability density function (pdf). Regardless of which method is used, unknown terms that must be modeled, appear. The major difficulty in the moment-transport method is the closure of the mean chemical reaction term. Two methods to obtain this have been tested. One is based on viewing the smallest eddies of the turbulence as homogeneous reactors. This allows for a detailed treatment of the chemistry. The other approach assumes a particular shape for the pdf. When the transport equation for the pdf is solved, the effects of chemical reaction appear in closed form. The main difficulty in the pdf-transport method is the modeling of the effects of molecular diffusion on the pdf. Some kind of reduced chemistry is required

when using the pdf-transport method. The ILDM method is ideally suited for this. 153 refs., 94 figs., 6 tabs.

6304 (SAND–94-2639C) **Nonequilibrium multiphase mixture modeling of energetic material response.** Baer, M.R.; Hertel, E.; Bell, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410254–1: Nuclear explosives code developers conference (NECDC), Las Vegas, NV (United States), 27 Oct 1994). Order Number DE95003353. Source: OSTI; NTIS; GPO Dep.

To model the shock-induced behavior of porous or damaged energetic materials, a nonequilibrium mixture theory has been developed and incorporated into the shock physics code, CTH. Foundation for this multiphase model is based on a continuum mixture formulation given by Baer and Nunziato. In this nonequilibrium approach, multiple thermodynamic and mechanics fields are resolved including the effects of material relative motion, rate-dependent compaction, drag and heat transfer interphase effects and multiple-step combustion. Benchmark calculations are presented which simulate low-velocity piston impact on a propellant porous bed and experimentally-measured wave features are well replicated with this model. This mixture model introduces micromechanical models for the initiation and growth of reactive multicomponent flow which are key features to describe shock initiation and self-accelerated deflagration-to-detonation combustion behavior. To complement one-dimensional simulation, two dimensional numerical simulations are presented which indicate wave curvature effects due to the loss of wall confinement.

6305 (CONF-950232–4) **Robust pose determination for autonomous docking.** Goddard, J.S.; Jatko, W.B.; Ferrell, R.K.; Gleason, S.S. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. American Nuclear Society meeting on robotics and remote systems; Monterey, CA (United States); 5-10 Feb 1995. Order Number DE95000687. Source: OSTI; NTIS; GPO Dep.

This paper describes current work at the Oak Ridge National Laboratory to develop a robotic vision system capable of recognizing designated objects by their intrinsic geometry. This method, based on single camera vision, combines point features and a model-based technique using geometric feature matching for the pose calculation. In this approach, 2-D point features are connected into higher-order shapes and then matched with corresponding features of the model. Pose estimates are made using a closed-form point solution based on model features of four coplanar points. Rotations are represented by quaternions that simplify the calculations in determining the least squares solution for the coordinate transformation. This pose determination method including image acquisition, feature extraction, feature correspondence, and pose calculation has been implemented on a real-time system using a standard camera and image processing hardware. Experimental results are given for relative error measurements.

6306 (DOE/MC/29115–95/C0403) **ARIES: A mobile robot inspector.** Byrd, J.S. South Carolina Univ., Columbia, SC (United States). Dept. of Electrical and Computer Engineering. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29115. (CONF-950232–7: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95001589. Source: OSTI; NTIS; INIS; GPO Dep.

ARIES (Autonomous Robotic Inspection Experimental System) is a mobile robot inspection system being developed for the Department of Energy (DOE) to survey and inspect drums containing mixed and low-level radioactive waste stored in warehouses at DOE facilities. The drums are typically stacked four high and arranged in rows with three-foot aisle widths. The robot will navigate through the aisles and perform an autonomous inspection operation, typically performed by a human operator. It will make real-time decisions about the condition of the drums, maintain a database of pertinent information about each drum, and generate reports.

6307 (DOE/MC/30362–95/C0405) **BOA: Pipe-asbestos insulation removal robot system.** Schempf, H. (and others); Bares, J.; Mutschler, E. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Robotics Inst. [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AR21-93MC30362. (CONF-950232–6: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95001590. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the BOA system, a mobile pipe-external crawler used to remotely strip and bag (possibly contaminated) asbestos-containing lagging and insulation materials (ACLIM) from various diameter pipes in (primarily) industrial installations across the DOE weapons complex. The mechanical removal of ACLIM is very cost-effective due to the relatively low productivity and high cost involved in human removal scenarios. BOA, a mechanical system capable of removing most forms of lagging (paper, plaster, aluminum sheet, clamps, screws and chicken-wire), and insulation (paper, tar, asbestos fiber, mag-block) uses a circular cutter and compression paddles to cut and strip the insulation off the pipe through compression, while a HEPA-filter and encapsulant system maintain a certifiable vacuum and moisture content inside the system and on the pipe, respectively. The crawler system has been built and is currently undergoing testing. Key design parameters and performance parameters are developed and used in performance testing. Since the current system is a testbed, we also discuss future enhancements and outline two deployment scenarios (robotic and manual) for the final system to be designed and completed by the end of FY '95. An on-site demonstration is currently planned for Fernald in Ohio and Oak Ridge in Tennessee.

6308 (DOE/RL–94-106) **Needs assessment activity report.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Transportation Management Div. Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004145. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a Transportation Management Division task (TMD), the Packaging Programs and Testing Group within Westinghouse Hanford Company (WHC) has assessed the packaging needs of some of the mid- and small-sized US Department of Energy (DOE) sites by visiting them and meeting with their transportation and packaging personnel. To date, ten DOE facilities have been visited. As a result, these sites have been informed of some of the packaging activities that TMD has sponsored and is sponsoring, have been apprised of possible upcoming changes to transportation regulations, have discussed their short-term packaging needs, and have shared unique packaging they have developed which may be of use to other DOE facilities.. This report summarizes the findings from visits to the following sites: Fermi National Laboratory; Argonne National Laboratory; New Brunswick Laboratory; EG and G Mound Applied Technologies; Fernald Environmental Management Project; West Valley Demonstration Project; Lawrence Berkeley Laboratory; Stanford Linear Accelerator Center; Brookhaven National Laboratory; and Princeton Plasma Physics Laboratory.

6309 (ETDE/DE-mf–95726909) **New piping techniques through insulated, compensating ductile cast iron socket pipes and efficient laying of supply pipes. Part-project: New techniques for service pipe insertion.** Zeller, A. Technische Werke der Stadt Stuttgart Antigua and Barbuda (TWS) (Germany). Hauptabteilung Rohrnetze fuer Gas, Wasser, Fernwaerme. Oct 1990. 165p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Forschungszentrum Juelich GmbH (Germany). Projekttraeger Biologie, Energie,

Oekologie. Foerderkennzeichen BMFT 0328789C. Order Number DE95726909. Source: OSTI; NTIS (US Sales Only).

The cost of piping considerably depends on the share of civil engineering works, i.e. on pavement scarifying and restoration, and on the extent to which digging impedes vehicle parking and traffic flow. Methods and machines which help to avoid scarifying were developed, therefore, as one was looking for ways of reducing the cost of gas and water pipe insertion. Already in the sixties the Technische Werke der Stadt Stuttgart AG utilities introduced the so-called Polish rocket with pneumatic steel cylinder. Displacing the soil the Polish rocket penetrates the ground leaving a hole about 100 mm in diameter for insertion of the gas or water pipe. Some recently developed types of that kind are provided with driving heads with built-in transmitters for position and height locating. Standard locating and control systems were not provided before the horizontal drilling methods were introduced. The new methods paved the way for greater drilling lengths. Today, the service pipe insertion method is also available for supply pipe laying parallel to the road axes. (orig./KO)

6310 (ETDE/DE-mf–95726910) **New piping techniques through insulated, compensating ductile cast iron socket pipes and efficient laying of supply pipes. Final report.** Zeller, A. Technische Werke der Stadt Stuttgart Antigua and Barbuda (TWS) (Germany). Hauptabteilung Rohrnetze fuer Gas, Wasser, Fernwaerme. Sep 1993. 151p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Forschungszentrum Juelich GmbH (Germany). Projekttraeger Biologie, Energie, Oekologie. Foerderkennzeichen BMFT 0328789C. Order Number DE95726910. Source: OSTI; NTIS (US Sales Only).

Easy-to-manufacture cast iron district heating pipes considerably reduce the cost of pipe construction. Mounting of the proven rubber joint socket ends used on drinking water pipes is less time-consuming and less expensive. Provided proper socket end designs, the thermal expansion of pipes is compensated. There is no need for complex systems for the compensation of temperature-dependent elongations. Controlled pipe displacements ensure very small supply pipe movements and an easier installation of outgoing service pipes. The replacement of steel pipes by cast iron pipes reduces the cost of piping because there is no need for sectional prestressing. Pipe sections can be mounted, therefore, and long, open ditches which are disadvantageous as regards high urban traffic densities can be avoided. Building site equipment advance payments can be reduced. (orig.)

6311 (INEL/MISC–94005) **Better define your customers facility requirements by optimizing your customers processes with value engineering before conceptual design.** Carpenter, R.L. Jr. EG and G Idaho, Inc., Idaho Falls, ID (United States). 19 Nov 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95002033. Source: OSTI; NTIS; GPO Dep.

This paper addresses a new value engineering approach successfully being used at the Idaho National Engineering Laboratory (INEL) in the design process of major construction projects. Of particular interest is how value engineers are applying the principles of Total Quality Management (TQM), utilizing value engineering techniques. Discussed are the associated problems with how major construction projects were previously planned, designed, value engineered, and then redesigned. Benefits of applying value engineering techniques early-on in the design process, far ahead of the traditional time for VE execution, is examined. The author provides a pro-con analysis of the benefits of early-on value engineering effort, and uses data gathered from several value engineering studies to support the conclusions of this paper.

6312 (KCP–613-5500) **Integrated product definition representation for agile numerical control applications.** Simons, W.R. Jr.; Brooks, S.L.; Kirk, W.J. III; Brown, C.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9410197–2: Mid-America conference on intelligent systems, Overland Park, KS (United States), 27 Oct 1994). Order Number DE95003391. Source: OSTI; NTIS; GPO Dep.

Realization of agile manufacturing capabilities for a virtual enterprise requires the integration of technology, management, and work force into a coordinated, interdependent system. This paper is focused on technology enabling tools for agile manufacturing within a virtual enterprise specifically relating to Numerical Control (N/C) manufacturing activities and product definition requirements for these activities.

6313 (KCP–613-5502) **Feature-based tolerancing for advanced manufacturing applications.** Brown, C.W.; Kirk, W.J. III; Simons, W.R.; Ward, R.C.; Brooks, S.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9410253–1: Applications in manufacturing and services industries conference, Kansas City, MO (United States), 27-28 Oct 1994). Order Number DE95003390. Source: OSTI; NTIS; GPO Dep.

A primary requirement for the successful deployment of advanced manufacturing applications is the need for a complete and accessible definition of the product. This product definition must not only provide an unambiguous description of a product's nominal shape but must also contain complete tolerance specification and general property attributes. Likewise, the product definition's geometry, topology, tolerance data, and modeler manipulative routines must be fully accessible through a robust application programmer interface. This paper describes a tolerancing capability using features that complements a geometric solid model with a representation of conventional and geometric tolerances and non-shape property attributes. This capability guarantees a complete and unambiguous definition of tolerances for manufacturing applications. An object-oriented analysis and design of the feature-based tolerance domain was performed. The design represents and relates tolerance features, tolerances, and datum reference frames. The design also incorporates operations that verify correctness and check for the completeness of the overall tolerance definition. The checking algorithm is based upon the notion of satisfying all of a feature's toleranceable aspects. Benefits from the feature-based tolerance modeler include: advancing complete product definition initiatives, incorporating tolerances in product data exchange, and supplying computer-integrated manufacturing applications with tolerance information.

6314 (SAND–94-1624C) **An experimental algorithm for detecting damage applied to the I-40 bridge over the Rio Grande.** Mayes, R.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950240–1: International modal analysis conference, Nashville, TN (United States), 13-16 Feb 1995). Order Number DE95001832. Source: OSTI; NTIS; GPO Dep.

An algorithm originally used to locate errors in finite element models is applied to a full scale bridge damage detection experiment. The method requires experimental frequency response function data measured at discrete locations along the major bridge load paths. In the bridge damage application the algorithm is most effective when applied to static flexibility shapes estimated with a truncated set of six mode shapes rather than individual mode shapes. The algorithm compares "before damage" and "after damage" data to locate physical areas where significant stiffness changes have occurred. A damage indicator shows whether damage is detectable. Damage is correctly located in the two most significant damage cases using the driving point static flexibility estimates. Limitations of the technique are addressed. The damage detection experiment was performed on a three span steel girder bridge that was 425 feet long. This bridge was part of Interstate 40 across the Rio Grande. The New Mexico State University Department of Civil Engineering organized the experiment. The frequency response functions were collected by Los Alamos National Laboratories personnel. The bridge excitation was provided by Sandia National Laboratories.

6315 (SAND–94-2215C) **Capillary flow on narrow strips and in V-shaped grooves.** Yost, F.G.; Holm, E.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950344–3: InterPack '95: international

electronic packaging conference, Maui, HI (United States), 26-30 Mar 1995). Order Number DE95000543. Source: OSTI; NTIS; GPO Dep.

Simple models for the flow of solder onto a copper metallized strip and into V-shaped groves in copper were derived and compared to experimental results. The conditions for initiation of flow are established and followed by the determination of flow rates for the two geometrical configurations. The analysis leads to the conclusion that the standard approach to capillary flow is adequate for describing these kinetics. A computer simulation using the interfacial energy minimization code Surface Evolver, is also used to examine these systems and it is shown that it does predict the experimentally observed morphologies. The two approaches are compared and similarities are discussed.

6316 (SAND–94-2368) **Simulation of impact of the Generic Accident-Resistant Packaging (GAP).** Slavin, A.M. Sandia National Labs., Albuquerque, NM (United States). Oct 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95003986. Source: OSTI; NTIS; INIS; GPO Dep.

Finite element simulations modelling impact of the Generic Accident-Resistant Packaging (GAP) have been performed. The GAP is a nuclear weapon shipping container that will be used by accident response groups from both the United States and the United Kingdom. The package is a thin-walled steel structure filled with rigid polyurethane foam and weighs approximately 5100 lbs when loaded. The simulations examined 250 ft/s impacts onto a rigid target at several orientations. The development of the finite element model included studies of modelling assumptions and material parameters. Upon completion of the simulation series, three full-scale impact tests were performed. A comparison of the simulation results to the test data is given. Differences between the results and data are examined, and possible explanations for the differences are discussed.

6317 (SAND–94-2375) **Application Protocol, Initial Graphics Exchange Specification (IGES), Layered Electrical Product.** O'Connell, L.J. (ed.). Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 261p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004266. Source: OSTI; NTIS; GPO Dep.

An application protocol is an information systems engineering view of a specific product The view represents an agreement on the generic activities needed to design and fabricate the product the agreement on the information needed to support those activities, and the specific constructs of a product data standard for use in transferring some or all of the information required. This application protocol describes the data for electrical and electronic products in terms of a product description standard called the Initial Graphics Exchange Specification (IGES). More specifically, the Layered Electrical Product IGES Application Protocol (AP) specifies the mechanisms for defining and exchanging computer-models and their associated data for those products which have been designed in two dimensional geometry so as to be produced as a series of layers in IGES format The AP defines the appropriateness of the data items for describing the geometry of the various parts of a product (shape and location), the connectivity, and the processing and material characteristics. Excluded is the behavioral requirements which the product was intended to satisfy, except as those requirements have been recorded as design rules or product testing requirements.

6318 (SAND–94-2402C) **Optimal control design that accounts for model mismatch errors.** Kim, T.J. (Sandia National Labs., Albuquerque, NM (United States)); Hull, D.G. Sandia National Labs., Albuquerque, NM (United States). [1924]. 8p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950248–1: American Aeronautics Society/American Institute of Aeronautics and Astronautics Space flight mechanics meeting, Albuquerque, NM (United States), 13-15 Feb 1995). Order Number DE95002605. Source: OSTI; NTIS; GPO Dep.

A new technique is presented in this paper that reduces the complexity of state differential equations while accounting for modeling assumptions. The mismatch controls are defined as the differences between the model equations and the true state equations. The performance index of the optimal control problem is formulated with a set of tuning parameters that are user-selected to tune the control solution in order to achieve the best results. Computer simulations demonstrate that the tuned control law outperforms the untuned controller and produces results that are comparable to a numerically-determined, piecewise-linear optimal controller.

6319 (SAND–94-2681C) **The role of force measurements in advanced vibration test methods.** Smallwood, D.O. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950240–2: International modal analysis conference, Nashville, TN (United States), 13-16 Feb 1995). Order Number DE95001833. Source: OSTI; NTIS; GPO Dep.

The role of force measurements in vibration testing is discussed. The rational for a vibration test based on the extremal control of force and acceleration is developed. The differences between force measurements in vibration testing and modal testing is discussed. Several methods for estimating the input force in a vibration test are outlined.

6320 (SAND–94-2702C) **A modal test design strategy for model correlation.** Carne, T.G.; Dohrmann, C.R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950240–4: International modal analysis conference, Nashville, TN (United States), 13-16 Feb 1995). Order Number DE95003631. Source: OSTI; NTIS; GPO Dep.

When a modal test is to be performed for purposes of correlation with a finite element model, one needs to design the test so that the resulting measurements will provide the data needed for the correlation. There are numerous issues to consider in the design of a modal test; two important ones are the number and location of response sensors, and the number, location, and orientation of input excitation. From a model correlation perspective, one would like to select the response locations to allow a definitive, one-to-one correspondence between the measured modes and the predicted modes. Further, the excitation must be designed to excite all the modes of interest at a sufficiently high level so that the modal estimation algorithms can accurately extract the modal parameters. In this paper these two issues are examined in the context of model correlation with methodologies presented for obtaining an experiment design.

6321 (SAND–94-2761) **Optical generation of radio-frequency power.** Hietala, V.M.; Vawter, G.A.; Brennan, T.M.; Hammons, B.E.; Meyer, W.J. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005276. Source: OSTI; NTIS; INIS; GPO Dep.

An optical technique for high-power radio-frequency (RF) signal generation is described. The technique uses a unique photodetector based on a traveling-wave design driven by an appropriately modulated light source. The traveling-wave photodetector (TWPD) exhibits simultaneously a theoretical quantum efficiency approaching 100 % and a very large electrical bandwidth. Additionally, it is capable of dissipating the high-power levels required for the RF generation technique. The modulated light source is formed by either the beating together of two lasers or by the direct modulation of a light source. A system example is given which predicts RF power levels of 100's of mW's at millimeter wave frequencies with a theoretical "wall-plug" efficiency approaching 34%.

6322 (WHC-SD-CP-SA–023-Rev.1) **Structural evaluation of the 2736Z Building for seismic loads.** Giller, R.A. Westinghouse Hanford Co., Richland, WA (United States). 23 Sep 1994. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003245. Source: OSTI; NTIS; INIS; GPO Dep.

The 2736Z building structure is evaluated for high-hazard loads. The 2736Z building is analyzed herein for normal and seismic loads and is found to successfully meet the guidelines of UCRL-15910 along with the related codes requirements.

6323 (WHC-SD-NR-CSER–010) **Criticality safety evaluation report for 300 Area N Reactor fuel fabrication and storage facility.** Schwinkendorf, K.N. Westinghouse Hanford Co., Richland, WA (United States). Dec 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE94015643. Source: OSTI; NTIS; INIS; GPO Dep.

Criticality safety support calculations for the 300 Area Fuels Manufacturing Facility have been performed to update values currently found in the criticality prevention specifications. The old safe masses and associated dimensions table has been updated with new values, which were produced using more modern computer codes that comply with Software Quality Assurance (SQA) requirements. Monte Carlo calculations, using MCNP (Carter 1991), were performed to spot check these results, obtained using the WIMS-E code (Gubbins et. al. 1982). In addition, the criticality considerations associated with certain accident, or upset, conditions were analyzed. These scenarios include fire, the bringing together of multiple safe masses into one neutronically coupled system, mis-stacking, and accidental interspersed moderation.

6324 (WHC-SD-SQA-CSA–20382) **CSER 79-028, Addendum 2: Security bar addition to pedestal storage racks in Room 3 in 2736-Z Building.** Miller, E.M. Westinghouse Hanford Co., Richland, WA (United States). 18 Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004147. Source: OSTI; NTIS; INIS; GPO Dep.

The Plutonium Finishing Plant (PFP) is installing security bars on plutonium storage racks in Room 3 in 2736-Z Building to meet International Atomic Energy Agency (IAEA) material control requirements. Figures show the existing arrangement and design of the security bars. The security bars are to be fabricated of aluminum or carbon steel. The detailed fabrication sketches are reproduced in Appendix C. The security bars are to be installed close to the chains of plutonium so a determination of their effect on criticality safety needs to be made. The addition of security bars to the storage array of 2.5 kg plutonium buttons in Room 3 can effect reactivity by reflecting neutrons back into the plutonium in the storage cans, by absorbing neutrons, and by moderating neutrons between stored plutonium buttons. The small amount of metal added by the storage bars in comparison to the amount of concrete in the walls and aluminum in the shelf monitors already in place would not significantly increase the k_{eff} of the storage array. Several computer calculations in previous analyses show that the security bars will have a negligible affect on reactivity.

6325 (WHC-SD-TP-DRR–003) **NFR TRIGA package design review report.** Clements, M.D. Westinghouse Hanford Co., Richland, WA (United States). 26 Aug 1994. 366p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE94018437. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to compile, present and document the formal design review of the NRF TRIGA packaging. The contents of this document include: the briefing meeting presentations, package description, design calculations, package review drawings, meeting minutes, action item lists, review comment records, final resolutions, and released drawings. This design review required more than two meeting to resolve comments. Therefore, there are three meeting minutes and two action item lists.

6326 (WHC-SD-W320-DA–004) **Spool assembly support analysis.** Norman, B.F. Westinghouse Hanford Co., Richland, WA (United States). 7 Oct 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003280. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the wind/seismic analysis and evaluation for the pump pit spool assemblies. Hand calculations were used for the analysis. UBC, AISC, and load factors were used in this evaluation. The results show that the actual loads are under the allowable loads and all requirements are met.

6327 (WHC-SD-W320-DA–005) **Shot loading platform analysis.** Norman, B.F. Westinghouse Hanford Co., Richland, WA (United States). 4 Oct 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003278. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the wind/seismic analysis and evaluation for the shot loading platform. Hand calculations were used for the analysis. AISC and UBC load factors were used in this evaluation. The results show that the actual loads are under the allowable loads and all requirements are met.

6328 (WHC-SD-WM-ER–390) **Stress analysis of shielded receiver lifting frame for core sampler truck #2.** Ziada, H.H. Westinghouse Hanford Co., Richland, WA (United States). 4 Nov 1994. 272p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003868. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis evaluates the structural design adequacy of the shielded receiver lifting frame (SRLF) for the rotary mode core sampler truck number 2 (RMCST#2). The analysis considers the loads expected during operation of the SRLF. Most of the existing welds were not in conformance with those specified on the drawings, H-2-91715 and -91716 (RHO 1988a and RHO 1988b). Stress analysts and engineers examined the configuration of the welds connecting the frame members of the SRLF and those connecting the SRLF to the drill rig. In comparison to those shown on the drawing, some of the actual welds appear stronger and others undersized. For example, the actual fillet welds completely encircle the junctures of members, although the drawings show some welds to be on two sides only. Attempts to find the original design calculations were unsuccessful. To resolve the nonconformance, the critical welds were identified by analysis and subsequently inspected to ensure they are as large or larger than the minimum is defined by weld leg size. A required weld size, as determined by stress analysis, of 0.1 inch or larger is considered to be critical. This size was selected because no existing welds were found to be less than 0.125 inch. Analysis results led to weld modifications to strengthen the SRLF. The weld modifications performed are described in WHC 1994.

6329 (WHC-SD-WM-TI–654) **Documentation for initial testing and inspections of Beneficial Uses Shipping System (BUSS) Cask.** Lundeen, J.E. Westinghouse Hanford Co., Richland, WA (United States). 25 Aug 1994. 262p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001237. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to compile data generated during the initial tests and inspections of the Beneficial Uses Shipping System (BUSS) Cask. In addition, this report will verify that the testing criteria identified in section 8.1 of the BUSS Cask Safety Analysis Report for Packaging (SARP) was met. The BUSS Cask Model R-1 is a type B shipping container used for shipment of radioactive cesium-137 and strontium-90 capsules to Waste Encapsulation and Storage Facility (WESF). The BUSS Cask body and lid are each one-piece forgings fabricated from ASTM A473, Type 304 stainless steel. The primary purpose of the BUSS Cask is to provide shielding and confinement as well as impact, puncture, and thermal protection for the capsules under both normal and accident conditions. Chapter 8 of the BUSS Cask SARP requires several acceptance tests and inspections, each intended to evaluate the performance of different components of the BUSS Cask system, to be performed before its first use. The results of the tests and inspections required are included in this document.

6330 (WHC-SD-WM-TI–659) **Documentation for first annual testing and inspections of Benificial Uses Shipping System (BUSS) Cask.** Lundeen, J.E. Westinghouse Hanford Co., Richland, WA (United States). 23 Aug 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001030. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to compile date generated during the first annual tests and inspections of the Benificiai Uses Shipping System (BUSS) Cask. In addition, this report will verify that the testing criteria identified in chapter 8 of the BUSS Cask Safety Analysis Report for Packaging (SARP) was met. Section 8.2 "Maintenance and Periodic Inspection Program" of the BUSS Cask SARP requires that the following tests and inspections be performed on an annual basis: Hydrostatic pressure test; helium leak

test; dye penetrant test on the trunnions and lifting lugs; and torque test on all bolts; impact limiter inspection and weight test. The first annual inspections and testing of the BUSS Cask were completed on May 5, 1994, and met the SARP criteria.

6331 (WHC-SD-WM-TI–672) **Documentation for fiscal year 1995 annual BUSS cask SARP testing and inspections.** Saueressig, P.T. Westinghouse Hanford Co., Richland, WA (United States). 8 Nov 1994. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003847. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to compile the data generated during the Fiscal Year (FY) 1995 annual tests and inspections performed on the Beneficial Uses Shipping System (BUSS) cask. The BUSS Cask Model R-1 is a type B shipping container used for shipment of radioactive cesium-137 and strontium-90 capsules to Waste Encapsulation and Storage Facility (WESF). The primary purpose of the BUSS Cask is to provide shielding and confinement as well as impact, puncture, and thermal protection for the capsules under both normal and accident conditions. Section 8.2 "Maintenance and Periodic Inspection Program" of the BUSS Cask SARP requires that the following tests and inspections be performed on an annual basis: hydrostatic pressure test; helium leak test; dye penetrant test on the trunnions and life lugs; torque test on all permanent bolts; and impact limiter inspection and weight test. In addition to compiling the generated data, this report will verify that the testing criteria identified in section 8.2 of the BUSS Cask Safety Analysis Report for Packaging (SARP) was met.

6332 (WHC-SD-WM-WP–289-Rev.1) **Engineering work plan for container venting system drill press assembly troubleshooting. Revision 1.** Prather, M.C. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003992. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan is for troubleshooting the current CVS drill press to ensure that the drill bit assembly doesn't bind in the press plate. A drill press assembly has been fabricated for the Container Venting System (CVS). The drill bit assembly has bound in the press plate in previous revisions of this design. Initial troubleshooting of the drill press per Rev. 0 of this work plan was performed at the 200W Kaiser Machine Shop under Work Package 2H9401670F, Internal Work Order E20027. The drill press operated without jamming. Then, during the pre-operational test on 11/14/17 and the operational test on 11/17/94, two drum lids were drilled. Immediately after the test on 11/17/94, the drill was again operated, and it jammed. An inspection found shavings at the bottom of the drill bit assembly, between the drill bit sleeve and the press plate bore. This revised work plan provides direction for the machine shop to diagnose and correct this recent problem.

6333 (WSRC-RP–94-1132) **Nuclear criticality safety analysis summary report: The S-Area Defense Waste Processing Facility sludge-only operation.** Ha, B.C. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95003484. Source: OSTI; NTIS; INIS; GPO Dep.

The S-Area Defense Waste Processing Facility (DWPF) can process all of the high level radioactive wastes currently stored at the Savannah River Site with negligible risk of nuclear criticality under the sludge-only operation. The characteristics which make the DWPF critically safe are: (1) abundance of neutron absorbers in the waste feeds, (2) and low concentration of fissionable material. This report documents the criticality safety arguments for the S-Area sludge-only DWPF process as required by DOE orders to characterize and to justify the low potential for criticality. It documents that the nature of the waste feeds and the nature of the DWPF process chemistry preclude criticality. The DWPF coupled-free operation is covered under another summary report, WSRC-RP-94-396.

4204 Heat Transfer and Fluid Flow

6334 (ANL–94/32) **Development of a small-channel nucleate-boiling heat transfer correlation.** Kasza, K.E.; Wambsganss, M.W. Argonne National Lab., IL (United States). Jun 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004243. Source: OSTI; NTIS; GPO Dep.

Development of an improved semimechanistic-based set of correlation parameters for nucleation-dominant flow-boiling heat transfer in small channels is described. Formulation of these parameters is on the basis of a recently published open-literature model for vapor bubble growth at a heated surface. This work is part of a program directed at obtaining an understanding of the physical mechanisms that influence boiling in compact heat exchangers through the use of high-speed video and microscope optics to characterize bubble nucleation, growth, and interaction with the confining walls of small heat transfer passages. The correlation parameters presented here represent the first step in the development of an improved boiling correlation for geometrically confined small-channel flows. In such flows, the nucleating bubbles can become nominally the same size as the channel cross section, thereby invalidating existing correlations that are based on large-channel data. Initial efforts to correlate small-channel-boiling data obtained at Argonne National Laboratory from nontransparent electrically heated metal tube tests appear promising.

6335 (BNWL-SA–1767) **Mass transfer at the solid-liquid interface for climbing film flow in an annular duct.** Sutey, A.M.; Knudsen, J.G. Battelle-Northwest, Richland, WA (United States). Pacific Northwest Lab. 9 Apr 1968. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE94018422. Source: OSTI; NTIS; GPO Dep.

A method utilizing a diffusion controlled electrochemical reaction was used to measure average and instantaneous mass transfer coefficients at the solid-liquid interface in upward gas-liquid climbing film flow in a vertical annular duct. These measurements give some indication of the mechanics of flow of the film, the extent of turbulence at the inner wall, and the effect of film thickness and wave motion on the mass transfer process at the inner wall. Predictions of incipient downflow of the film, shear stress at the inner wall, and interfacial shear stress were obtained from these measurements. Fluctuations in the velocity gradient at the inner wall were also studied. Results of this study are in fair agreement with previous work and with theoretical predictions based on simplified momentum balance concepts.

6336 (DLR-FB–93-54) **A model of droplet evaporation in a supercritical pressure environment.** Olthoff, P. Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Hardthausen am Kocher (Germany). Inst. fuer Chemische Antriebe und Verfahrenstechnik; Technische Univ. Braunschweig (Germany). Fakultaet fuer Maschinenbau und Elektrotechnik. Dec 1993. 162p. (In German). Order Number DE95733253. Source: OSTI; NTIS (US Sales Only).

Droplet evaporation in high temperature and high pressure environment has been investigated. In theoretical investigations of a further developed mathematical droplet evaporation model has been found the importance of the effects of non ideal gas behavior for the calculation of the mole or mass fraction for the vapor-liquid equilibrium at the droplet boundary and the effects of real enthalpy of vaporization. Therefore in a high pressure environment the effect of absorption is very important. Physical properties have to be calculated as a function of temperature and pressure. In order to make experiments a high pressure and high temperature experimental apparatus has been developed, in which the evaporation of a single heptane droplet in nitrogen gas environment could be observed and droplet size-time and temperature-time histories could be measured. The environmental gas pressure range was p_{Umg}=2-100 bar and the ambient gas temperature range was T_{Umg}=296-773 K. The theoretical and experimental results, also the experimental results of earlier experimentators, were in excellent correspondence. (orig.)

6337 (DOE/ER/14100–T1) **Hydrodynamic instabilities and coherent structures: Progress report, January 1, 1994–December 31, 1994.** Frenkel, A. Alabama Univ., University, AL (United States). Dept. of Mathematics. Aug 1991. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER14100. Order Number DE95004213. Source: OSTI; NTIS; GPO Dep.

The authors have derived a 3-dimensional dissipative-dispersive evolution equation for the film thickness for films flowing down inclined planes. They have also derived dissipative-dispersive evolution equations for 3-dimensional waves on films flowing down vertical cylinders. They have obtained and simulated numerically highly nonlinear evolution equations describing large-amplitude waves in core-annular flows. They have completed the numerical proof of negativity of the isotropic eddy viscosity for a sinusoidally oscillating triangular-eddy flow. Finally, they have developed an unusual generalization of Landau's equation to describe the nonlinear evolution of certain (steady) periodic flows slightly above the onset of the (intermediate-wavelength) instability.

6338 (ETDE/DE-mf–95733422) **Ludwig Prandtl, a biography. Memories, documents.** Mitteilungen aus dem Max-Planck-Institut fuer Stroemungsforschung, v. 107. Vogel-Prandtl, J. Max-Planck-Institut fuer Stroemungsforschung, Goettingen (Germany). 1993. 229p. (In German). Order Number DE95733422. Source: OSTI; NTIS (US Sales Only).

With his fundamental contributions towards applied mechanics, hydrodynamics, aerodynamics and gas dynamics, Ludwig Prandtl played a decisive part in bringing about development in these fields of science in the first half of this century. His collected works were brought out in three volumes a few years after his death, which provided subsequent generations with access to many of his publications. Yet this written heritage only represents a part of the lifetime of work for which the world of science has to thank this brillant scholar. He also contributed a great deal in the suggestions and ideas which he made in the work of his many students, employees and research colleagues right around the world. He devised the theories of the boundary layer and the aerofoil; he expounded fundamental ideas on the flow of compressible media and on the turbulent movement of liquid; he applied flow physics to meteorology. His contributions to the problems of elasticity, plasticity and rheology are also very worthy of note. He was able to carry out intensive fundamental research work at the Kaiser-Wilhelm Institute of Flow Research in Goettingen, relieved of the burden of any external requirements. He enjoyed particular success combining theory and experiments. In addition to the theories mentioned above (both of which have been accorded his name), he also developed wind tunnels and measurement apparatus to assist him in his experiments (such as Prandtl's tube and Prandtl's manometer), revealing himself to be an allround scholar. (orig.)

6339 (NEI-NO–463) **Algebraic and elliptic grid generation for computational fluid dynamics (CFD) applications.** Oerbekk, E. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1994. 145p. Order Number DE95723939. Source: OSTI; NTIS.

Computer codes have been developed for both algebraic and elliptic grid generation procedures, including a number of interactive post processor codes both for grid generation and flow solution plots. The computer codes are all based on a multi-block structure and are programmed in FORTRAN. Algebraic grid generators are preferable when generating large and complex three-dimensional (3D) grids, this mainly since they are very fast compared with the elliptic technique. Another significant feature of the algebraic method is the ability of having a high degree of control over the mesh point distribution. Although, compared with the elliptic method, there is no doubt that elliptic generated grid is smoother and more equally distributed than algebraic generated grids. In order to take advantages of both grid generation methods, "the speed from the algebraic one and the smoothness of the elliptic one", a grid generator based on both methods is developed. The initial generated grid should be based on the algebraic grid generation procedure. Further grid refinements should be based on the elliptic method combined with the initial algebraic generated grid. An efficient combination requires that the source functions are solved from a "high quality" algebraic generated grid. In order to keep most of the generated grid structure as it is initially defined, only local changes of the source functions are desired. The source functions are smoothed by the Laplace equations using a forward explicit Euler scheme. Source functions are more or less only smoothed in regions with discontinuities, and these modified source functions are used in an elliptic grid generator. The resulting grid has automatically been smoothed in regions with discontinuities. Additional adding of elliptic tools such as automatic forcing towards orthogonality can be used. 31 refs., 95 figs.

6340 (ORNL/M–3986) **MPI implementation of CFD program PHOENICS.** Simunovic, S. (Oak Ridge National Lab., TN (United States). Metals and Ceramics Div.); Zacharia, T. Oak Ridge National Lab., TN (United States). 26 Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95003896. Source: OSTI; NTIS; GPO Dep.

This document describes the work on Message Passing Interface (MPI) standard implementation of the parallel version of the solver EARTH for the Computational Fluid Dynamics (CFD) program PHOENICS. The Intel Paragon NX and MPI versions of the program have been developed and tested on massively parallel (MP) supercomputers Intel Paragon XP/S 5, XP/S 35, and Kendall Square Research (KSR) supercomputers at Oak Ridge National Laboratory (ORNL). The preliminary testing results of the developed program have shown scalable performance for reasonably sized computational domains.

6341 (PSI–94-16) **Development, implementation and assessment of specific closure laws for inverted-annular film-boiling in a two-fluid model.** Cachard, F. de (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Oct 1994. 96p. Order Number DE95611091. Source: OSTI; NTIS; INIS.

Inverted-annular film-boiling (IAFB) is one of the post-burnout heat transfer modes taking place, in particular, during the reflooding phase of the loss-of-coolant accident, when the liquid at the quench front is subcooled. Under IAFB conditions, a continuous liquid core is separated from the wall by a superheated vapour film. The heat transfer rate in IAFB is influenced by the flooding rate, liquid subcooling, pressure, and the wall geometry and temperature. These influences can be accounted by a two-fluid model with physically sound closure laws for mass, momentum and heat transfer between the wall, the vapour film, the vapour-liquid interface, and the liquid core. The applicability of existing IAFB two-fluid models is limited. This is attributed to shortcomings in the description of heat transfer within the liquid core, to use of certain correlations outside their validity range, and to a limited use of experimental information on IAFB. The usual approach has been to develop models employing generally applicable closure laws including, however, adjustable parameters, and to adjust these using global experimental results. The present approach has been to develop IAFB-specific closure laws in such a form that they could be adjusted separately using detailed, IAFB-relevant, experimental result. Steady-state results, including heat flux, wall temperature and void fraction data have been used for the adjustment. A key issue in IAFB modeling is to predict how the heat flux reaching the vapour-liquid interface is split into a liquid heating term and a vaporization term. In the model proposed, convective liquid heating is related to the liquid velocity relative to the interface, and not to the absolute liquid velocity, as in previous models. This relative velocity is deduced from the interfacial shear stress, using the liquid-interface friction law. With this modification, the prediction of the experimental trends is greatly improved. 6342 (SAND–93-0765) **Bubble growth, shock waves, and flow transients produced by underwater capacitor discharges.** Nelson, L.S.; Hogeland, S.R.; Utash, J.L. Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (NPRW-SA–92-11). Order Number DE95004279. Source: OSTI; NTIS (US Sales Only); GPO Dep.

As part of a combined theoretical and experimental effort to understand the initiation of steam explosions of molten aluminum, we have characterized bubble growth, shock waves and flow transients produced by high-voltage capacitor discharges through gold

bridgewires placed underwater. For the most part, our measured values have magnitudes adequate to test the applicability of Ciccarelli's new triggering mechanism to drops of molten aluminum. In appendices, we present preliminary results of experiments designed to chemically enhance the energies of the bubbles and shock waves generated by these underwater capacitor discharges.

6343 (SAND–94-2264C) **Solutions of turbulent backward-facing step flow with heat transfer using the finite volume method.** Horstman, R.H. (Boeing Commercial Airplane, Seattle, WA (United States). Environmental Control Systems R&D); Cochran, R.J.; Emergy, A.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941142–26: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 9-11 Nov 1994). Order Number DE95003360. Source: OSTI; NTIS; GPO Dep.

The heated turbulent flow over a backward-facing step is numerically solved using the commercial computational fluid dynamics program FLUENT. The methods used here consist of the default power-law upwinding scheme, default multigrid equation solution method and a standard k-ε turbulence model with wall functions. A total of four separate cases are reported. The four cases consist of combinations of partially and fully developed flow at the inlet with uniform or developed temperature profiles. Three mesh refinements are reported for each flow.

6344 (SAND–94-8597C) **Turbulent dispersion of particles: The STP model.** Baxter, L.L. (Brigham Young Univ., Provo, UT (United States)); Smith, P.J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940277–4: Atmospheric radiation measurement science team meeting, Charleston, SC (United States), 28 Feb - 3 mar 1994). Order Number DE94016616. Source: OSTI; NTIS; GPO Dep.

A mathematical description of the stochastic transport of particles (STP) model for particle dispersion in turbulent flows is presented. The STP model is based on established theories of stochastic process modeling. The parameters of the model include physical properties of the particle (diameter and mass) and a description of the turbulent characteristics (mean velocities with rms fluctuations and their residence-time correlations) of the fluid phase in which the particles are dispersed. The model includes no adjustable parameters in the sense of calibration factors. It is independent of any particular turbulence model, but estimates of its parameters from information available from the common k-ε turbulence model are presented. Elements of the STP model are compared with exact solutions of the diffusion equation, alternative dispersion models, and experimental data collected under well-defined conditions. The STP model reproduces the exact solutions when both are based on consistent assumptions. Suggested approximated terms in the model also reproduce the experimental data nearly within its error under simple flow conditions. The STP model describes the origin of more complex behavior (counter-gradient diffusion, for example) and has the potential of describing it if sufficient detail about the gas-phase turbulence is known.

6345 (UCRL-JC–118604) **The parallel performance of a groundwater flow code on the Cray T3D.** Ashby, S.F.; Falgout, R.D.; Smith, S.G.; Thompson, A.F.B. Lawrence Livermore National Lab., CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950212–3: 7. SIAM conference on parallel processing for scientific computing, San Francisco, CA (United States), 15-17 Feb 1995). Order Number DE95002843. Source: OSTI; NTIS; GPO Dep.

This paper summarizes some preliminary results on the parallel performance of ParFlow, a new code for the numerical simulation of groundwater flow through three-dimensional heterogeneous porous media. At present, this code is capable of simulating groundwater flow for large sites (10^7 spatial zones) on a variety of distributed memory MIMD machines. The computational kernels are described briefly and their parallel performance is examined on the Cray T3D massively parallel computer using Cray's implementation of the PVM message-passing library.

6346 (WAPD-T–3063) **Vertical natural convection heat transfer data for an enclosed fluid.** Coffield, R.D.; Harry, J.A. Bettis Atomic Power Lab., West Mifflin, PA (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-9409267–1: American Society of Mechanical Engineers fluids engineering summer meeting, Hilton Head, SC (United States), 13 Sep 1994 - 18 sep 1995). Order Number DE95003874. Source: OSTI; NTIS; GPO Dep.

Natural convection flow of enclosed fluids with high temperature gradients can result in extremely high heat transfer rates. This phenomenon must be accurately modeled in order to predict the correct temperature distribution of structures in contact with the convecting flow. Ignoring the heat transfer by natural convection and assuming only the normal molecular heat conduction of stagnant water can result in an underestimate of the heat transfer by several orders of magnitude. Natural convection of enclosed fluids is different than free convection to a non-enclosed (i.e., open) ambient atmosphere since the recirculating fluid flow pattern can have a significant influence on the resultant heat transfer. Rayleigh numbers extending the entire range from conditions where free convection is a second order effect (e.g., $Ra < 3000$) to those where turbulent free convection dominates (e.g., $Ra > 10^5$) were tested and the results described. Inconsistencies between earlier investigations reported in the literature are resolved because of the wide test range capability. Correlations of the data in the form of Nusselt number as a function of Rayleigh number are provided for $0 < Ra < 10^{12}$.

6347 (BNL–61087) **Inelastic neutron scattering for materials science and engineering.** Shapiro, S.M. Brookhaven National Lab., Upton, NY (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95003954. Source: OSTI; NTIS; INIS; GPO Dep.

The neutron is the ideal probe for studying the positions and motions of atoms in condensed matter. The main advantage of the neutron in inelastic scattering results from its heavy mass when compared to other particles which are used to probe materials such as the photon (light, x-rays, or γ-rays) or the electron. The author discusses the application of neutron scattering to study a number of different materials related problems, including, hard magnets, shape memory effects, and hydrogen distribution in metals.

6348 (ETDE/DE-mf–95726883) **Annual report 1993 of the Federal Office for Material Research and Testing.** Bundesanstalt fuer Materialforschung und -pruefung, Berlin (Germany). Apr 1994. 264p. (In German). Order Number DE95726883. Source: OSTI; NTIS (US Sales Only).

The present volume reports on the activities of the Federal Office for Material Research and Testing and its departments Metals and Metal Constructions, Building Materials and Building Structures, Organic Substances, Chemical Safety Technology, Functional Materials and Surfaces, Material-Independent Processes, Scientific and Technical Cross-Sectional Tasks, Environment-Related Material Technologies, Technical Reliability/Hazardous Material Encapsulation and Analytic Chemistry/Reference Materials. The work of the project groups Computer Tomography, High-Performance Ceramics, Database for Hazardous Materials (DGG) and ADR Structural Reform is also briefly reported on. (MM)

6349 (FRCEA-TH–410) **Resolution improvement of ultrasonic echography methods in non destructive testing by adaptative deconvolution.** Vivet, L. CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. d'Etudes des Combustibles; Paris-11 Univ., 91 - Orsay (France). 28 Sep

1989. 158p. (In French). Order Number DE95611124. Source: OSTI; NTIS (US Sales Only); INIS.

The ultrasonic echography has a lot of advantages which make it attractive for nondestructive testing. But the important acoustic energy useful to go through very attenuating materials can be got only with resonant translators, that is a limit for the resolution on measured echograms. This resolution can be improved by deconvolution. But this method is a problem for austenitic steel. Here is developed a method of time deconvolution which allows to take in account the characteristics of the wave. A first step of phase correction and a second step of spectral equalization which gives back the spectral contents of ideal reflectivity. The two steps use fast Kalman filters which reduce the cost of the method.

6350 (LA-UR–94-3806) **Prediction of material strength and fracture of brittle materials using the SPHINX smooth particle hydrodynamics code.** Mandell, D.A.; Wingate, C.A.; Stellingwwerf, R.F. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9405265–1: ASCE engineering mechanics conference, Boulder, CO (United States), 21-24 May 1994). Order Number DE95003684. Source: OSTI; NTIS; GPO Dep.

The design of many devices involves numerical predictions of the material strength and fracture of brittle materials. The materials of interest include ceramics that are used in armor packages; glass that is used in windshields; and rock and concrete that are used in oil wells. As part of a program to develop advanced hydrocode design tools, the authors have implemented a brittle fracture model for glass into the SPHINX smooth particle hydrodynamics code. The authors have evaluated this model and the code by predicting data from tungsten rods impacting glass. Since fractured glass properties, which are needed in the model, are not available, they did sensitivity studies of these properties, as well as sensitivity studies to determine the number of particles needed in the calculations. The numerical results are in good agreement with the data.

6351 (LA-UR–94-4014) **Algorithm for dual-energy radiographic analysis.** Morris, R.A.; Chancellor, T. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9407123–4: 1994 review of progress in quantitative nondestructive evaluation conference, Snowmass, CO (United States), 31 Jul - 5 aug 1994). Order Number DE95003675. Source: OSTI; NTIS; GPC Dep.

The use of two or more radiographs of an object taken with different x-ray spectral characteristics to infer quantitative values of material density or Z number has been of interest to both the medical and industrial worlds for some time. One method uses monoenergetic isotopic sources with well defined energies in conjunction with standard step wedges and solving the resulting simultaneous equations. Besides the problem of finding isotopic sources with the appropriate energies, you have to have a priori knowledge of the materials in the object. This paper describes an algorithm that does not impose any limitations on the energy spectrum of the sources nor require any knowledge of the object. The algorithm does require that the different radiographs have perfect spatial registration (within a pixel width) and assumes that the transmitted x-ray intensity spectra is the same (within a multiplicative constant) over the image plane. This paper is just a start in developing multi-energy techniques; objects with three or more materials have not been investigated and it is not clear just how this algorithm should be generalized to the multi-energy case.

6352 (LA-UR–94-4082) **What can we learn from off-specular neutron reflection?.** Pynn, R. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–5: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003635. Source: OSTI; NTIS; INIS; GPO Dep.

Specular reflection of neutrons or x rays has been developed recently as a tool to probe density variations in the neighborhood of flat interfaces. The techniques have been applied to a variety of materials problems ranging from polymer adsorption to hydrogenation of carbon films and the structure of magnetic multilayers. In addition to the specular scattering, diffuse scattering is often observed, sometimes in strikingly beautiful patterns. This scattering is caused by imperfections such as interfacial roughness or density fluctuations within a layer. As a general rule, the diffuse, off-specular scattering measures the density-density correlation function within and between the interfaces responsible for the specular scattering. Interpretation of diffuse x-ray and neutron scattering from surfaces and interfaces is in its infancy using theoretical schemes that are still being developed. In this talk the author shows examples of diffuse scattering patterns and offers some guidelines for their interpretation.

6353 (UCRL-ID–112775, pp. 6.11-6.15) **Characterizing the failure of composite materials.** Groves, S.E.; Sanchez, R.J.; Feng, W.W.; Brown, A.E.; DeTeresa, S.J.; Lyon, R.E. Lawrence Livermore National Lab., CA (United States). Mar 1993. In *Materials Science and Engineering.* 30p. Order Number DE94003018. Source: OSTI; NTIS; GPO Dep.

The goal for this project has been to characterize the three-dimensional (3-D) performance of continuous-fiber polymer composite materials, by developing new experimental and theoretical methods. This report highlights our major accomplishments: (1) multiaxial testing of composites; (2) the development of a new composite-failure criterion; (3) the development of ORTHO3D, a 3-D orthotropic finite element code; (4) the dynamic testing of composites; and (5) a helical compression study of filament-wound composite tubes. 6 refs., 8 figs., 1 tab.

The Burner Engineering Research Laboratory (BERL) was established with the purpose of providing a facility where manufacturers and researchers can study industrial natural gas burners using conventional and laser-based diagnostics. To achieve this goal, an octagonal furnace enclosure with variable boundary conditions and optical access that can accommodate burners with firing rates up to 2.5 MMBtu per hour was built. In addition to conventional diagnostic capabilities like input/output measurements, exhaust gas monitoring, suction pyrometry and in-furnace gas sampling, laser-based diagnostics available at BERL include planar Mie scattering, laser Doppler velocimetry and laser-induced fluorescence. This paper gives an overview of the operation of BERL and a description of the diagnostic capabilities and an estimate of the time required to complete each diagnostic for the potential user who is considering submitting a proposal.

6356 (CONF-9405258–, pp. 320-324) **Three-dimensional magnetic induced polarization (MIP) modeling.** Hishida, H. (Metal Mining Agency of Japan, Tokyo (Japan)); Noguchi, K. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The present paper reports the interpretation, by three-dimensional model calculation, of the result of an MIP survey on the HYC silver-lead-zinc deposit, McArthur River area, Australia. In case where the current dipole is oriented from north to south (as the deposit strikes) for the above survey, strong anomaly in RPS (index of anomaly in IP) appears in the vicinity of western deposit end. However, considerable anomaly does not appear in case of east-west orientation. Based on the geological information and physical property measurement result of borehole cores, modeled is an IP anomalous body composed of four rectangular parallelopiped blocks which respectively have a north-south length of 800m and vertical section of 100m by 100m, and are arrayed with their laterally touching each other and so buried as to eastward form a downward inclination of about 20° starting slightly below the surface. Assuming that the resistivity of the above body and surrounding medium is 10ohm m and 100ohm m, respectively, the RPS distribution is obtained by a three-dimensional model calculation with solution of integral equation. It is shown that the RPS thus obtained agrees well with that done from the MIP survey. 9 refs., 6 figs.

SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The excavation with a small diameter propelling tube inclined to the horizontal plane was fundamentally investigated using a miniature model of 1/10 size of the tube. The induction voltage generated in the receiving coil which was placed on the ground surface was measured when the AC was passed through the circular coil attached to the tip of the small diameter tube. The inclination (to the horizontal plane) of the receiving coil, which exhibited the minimum induction voltage, were measured at several points across the center axis of the predicted propelling tube, to obtain the depth of the tube axis from the ground surface. The similar measurement was also done at several points on the ground surface measurement line along the propelling tube. In the case of PVC tube, it was found that the inclination angle could be measured accurately when the depth of the tube tip was about 20 times of the radius of the transmitting coil. In the case of steel tube, on the other hand, it was found that the steel tube effect could be reduced by attaching the transmitting coil outside the tube rather than attaching it inside the tube. 2 refs., 8 figs.

6358 (NEI-NO–465) **Studies of weak and strong nonlinear sea loads on floating marine structures.** Zhao Rong. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. Apr 1994. 98p. Order Number DE95723941. Source: OSTI; NTIS.

This thesis consists of four selected papers of my work for the paste few years, which considers some problems of weak and strong nonlinear sea loads on floating marine structures. The weak nonlinear problem that we study here, is hydrodynamic loads on marine structures due to wave-current-body interaction. The strong nonlinear problem that we consider, is slamming loads on conventional and high-speed vessels. The first two papers deal with the wave-current-body interaction problem. A theoretical and numerical method to analyse wave-current interaction effects on large-volume structure is developed. The theory is based on matching a local solution to a far-field solution. In the far-field the waves "ride" on the undisturbed current velocity, while in the near-field the waves "ride" on the local steady flow. A boundary element method based on Green's second identity has been applied to solve the problem. The far-field solution is represented by a sum of multipoles with singularities inside the body. The multipoles satisfy the radiation condition and the far-field free-surface condition. The problem has been solved to first-order in incident wave amplitude and current velocity. In the free-surface conditions and body boundary conditions the local steady flow has been taken care of. The last two papers consider the slamming loads on marine structures. A numerical method for studying water entry of a two-dimensional body of arbitrary rigid cross-section is presented. A boundary element method has been used to solve the problem with nonlinear free-surface and body boundary conditions. Important features are how the jet flows occurring at the intersections between the free-surface and the body are handled, and how conservation of fluid mass is satisfied in areas of high curvature of the free-surface. The numerical results have been checked by satisfying conservation of mass, momentum and energy. 103 refs., 45 figs., 5 tabs.

6359 (CRIE-R–01) **Study on propagation impairments, distortions and unavailability on digital microwave links.** Serizawa, Y. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Dec 1993. 153p. (In Japanese). Order Number DE95723047. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-5-1, Ote-machi, Chiyoda-ku, Tokyo, Japan.

A study was made on propagation impairments (degradation) and distortions for design, route layout and operation of digital microwave links for information network basic telecommunication. As to multipath interference fading which causes distortions, a method to predict an outage probability of the link was introduced from in-band amplitude deviation. In the case of having system gains by influence of man-made structures, that is, in the case of the link in which the reflector is installed in the Fresnel region, in the reflector relay link, a precise measuring method to gain reflector was introduced. With the equivalent C/N degradation amount, a method was developed for estimation of influence quantity in the case of system loss (propagation impairments) caused by structures standing in the propagation path, and unnecessary reflection/scattered wave. With relation to CPM current differential teleprotection systems, a theoretical study was made on a relation between error ratio characteristics and relay motion at fading, indicating that the required bit error ratio is approximately 10^{-6} - 10^{-7}. 94 refs., 91 figs., 12 tabs.

6360 (DOE/CH/10093–298) **Smart Power/power integrated circuits, technology and applications: Proceedings.** National Renewable Energy Lab., Golden, CO (United States). Mar 1994. 359p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-931274–: 2. workshop on smart power/power-integrated circuits: technology and applications, Pasadena, CA (United States), 8-9 Dec 1993). Order Number DE94006867. Source: OSTI; NTIS; GPO Dep.

6361 (KCP–613-5515) **Piezoelectric motor development at AlliedSignal Inc., Kansas City Division.** Pressly, R.B.; Mentesana, C.P. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9411151–1: Technology 2004, Washington, DC (United

States), 8-10 Nov 1994). Order Number DE95003389. Source: OSTI; NTIS; GPO Dep.

The Kansas City Division of AlliedSignal Inc. has been investigating the fabrication and use of piezoelectric motors in mechanisms for United States Department of Energy (DOE) weapons applications for about four years. These motors exhibit advantages over solenoids and other electromagnetic actuators. Prototype processes have been developed for complete fabrication of motors from stock materials, including abrasive machining of piezoelectric ceramics and more traditional machining of other motor components, electrode plating and sputtering, electric poling, cleaning, bonding and assembly. Drive circuits have been fabricated and motor controls are being developed. Laboratory facilities have been established for electrical/mechanical testing and evaluation of piezo materials and completed motors. Recent project efforts have focused on the potential of piezoelectric devices for commercial and industrial use. A broad range of various motor types and application areas has been identified, primarily in Japan. The Japanese have been developing piezo motors for many years and have more recently begun commercialization. Piezoelectric motor and actuator technology is emerging in the United States and quickly gaining in commercial interest. The Kansas City Division is continuing development of piezoelectric motors and actuators for defense applications while supporting and participating in the commercialization of piezoelectric devices with private industry through various technology transfer and cooperative development initiatives.

6362 (LA-UR–94-3985) **Advanced technologies for a compact rf linac FEL.** Nguyen, D.C. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9408196–1: FEL '94: nuclear instrument methods, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95003674. Source: OSTI; NTIS; INIS; GPO Dep.

Advanced technologies such as the photoinjector, the short-period microwigglers, and harmonic lasing enable free-electron-laser operation in the infrared with a low-energy (~ 10 MeV) electron beam and thus reduce the size and cost of FELs. The next-generation, rf-linac FEL will fit in a small laboratory and produce high-power, picosecond infrared.

6363 (SAND–94-1112C) **Assessing capillary flow on printed wiring board surfaces.** Hosking, F.M.; Yost, F.G.; Hernandez, C.L.; Sackinger, S.J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950344–1: InterPack '95: international electronic packaging conference, Maui, HI (United States), 26-30 Mar 1995). Order Number DE94015768. Source: OSTI; NTIS; GPO Dep.

A solderability test for evaluating capillary flow on printed wiring boards is presented. The test measures the flow of molten solder from a pad of fixed diameter onto attached strips of different widths. The technique simulates capillary flow behavior, including wetting kinetics, during typical electronics soldering. A flow model is proposed. Computational and experimental data are compared.

6364 (SAND–94-1982C) **Using consumer IC packages in harsh high reliability applications.** Reber, C.A.; Palmer, D.W. Sandia National Labs., Albuquerque, NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950344–2: InterPack '95: international electronic packaging conference, Maui, HI (United States), 26-30 Mar 1995). Order Number DE94016565. Source: OSTI; NTIS; GPO Dep.

The improvements in purity of molding materials, the IC wafer passivation layers, and manufacturing quality have resulted over the last decade in extremely high reliability in commercial IC packages. In contrast the ceramic/hermetic package world is suffering from limited availability of the newest IC chips, higher cost, larger size, and decreasing quality and fewer manufacturing lines. Traditional manufacturing line qualification tests are a good start for conversion to commercial plastic parts. However, the use of standard sensitive test chips instead of product die is necessary to perform affordable, quantitative evaluations. These test chips have many integrated sensors measuring chemical, mechanical, thermal, and electrical degradation caused by manufacturing and the package environment. Besides visual, electrical test, and burn-in little has been documented on 100% nondestructive screening of plastic molded parts. Based on realistic process control and system engineer cultural expectations, user screening is necessary. Nondestructive tests of moisture and temperature excursion susceptibility are described.

6365 (SAND–94-2749C) **Solderability preservation through the use of organic inhibitors.** Sorensen, N.R.; Hosking, F.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950344–4: InterPack '95: international electronic packaging conference, Maui, HI (United States), 26-30 Mar 1995). Order Number DE95003633. Source: OSTI; NTIS; GPO Dep.

Organic inhibitors can be used to prevent corrosion of metals and have application in the electronics industry as solderability preservatives. We have developed a model to describe the action of two inhibitors (benzotriazole and imidazole) during the environmental aging and soldering process. The inhibitors bond with the metal surface and form a barrier that prevents or retards oxidation. At soldering temperatures, the metal-organic complex breaks down leaving an oxide-free metal surface that allows excellent wetting by molten solder. The presence of the inhibitor retards the wetting rate relative to clean copper, but provides a vast improvement relative to oxidized copper.

6366 (UCRL-JC–117859) **Low-cost packaging of high-performance optoelectronic components.** Lowry, M.; Lu, Shin-Yee; Pocha, M.; Strand, O.T. Lawrence Livermore National Lab., CA (United States). Aug 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940723–34: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 24-29 Jul 1994). Order Number DE95003645. Source: OSTI; NTIS; GPO Dep.

Optoelectronic component costs are often dominated by the costs of attaching fiber optic pigtails–especially for the case of single transverse mode devices. We present early results of our program in low-cost packaging. We are employing machine-vision controlled automated positioning and silicon microbench technology to reduce the costs of optoelectronic components. Our machine vision approach to automated positioning has already attained a positional accuracy of less than 5 microns in less than 5 minutes; accuracies and times are expected to improve significantly as the development progresses. Complementing the machine vision assembly is our manufacturable approach to silicon microbench technology. We will describe our silicon microbench optoelectronic device packages that incorporate built-in heaters for solder bonding reflow.

6367 (BNL–60963) **A report on the Indiana University Workshop on future U.S. hadron facilities.** Syphers, M.J. Brookhaven National Lab., Upton, NY (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9411120–2: 4. Tamura symposium on accelerator physics, Austin, TX (United States), 14-16 Nov 1994). Order Number DE95003951. Source: OSTI; NTIS; INIS; GPO Dep.

In July 1994 a workshop was held at Indiana University to study and discuss options for future hadron collider facilities in the United States, and to identify related R&D programs. The workshop was conducted under the auspices of the Accelerator Physics, Technologies, and Facilities Working Group of the DPF Long Term Planning Study. Roughly 50 participants from 17 institutions in the U.S. and Europe (CERN) were organized into six working groups to study magnets, cryogenics and vacuum, antiproton sources,

injectors, interaction regions, and lattice and beam dynamics. Upgrades to existing facilities (namely, Fermilab) and a post-LHC facility were discussed at the workshop. In this paper, the discussion will focus on the post-LHC facility. One of the specific goals of the workshop was to develop a defensible parameters list for a 30 TeV x 30 TeV hadron collider with luminosity of 1×10^{34} cm^{-2} sec^{-1}. While this accelerator would have only 50% higher energy than the SSC design, it was realized that the role of synchrotron radiation at this energy would significantly enhance the design and operation of the machine. Radiation damping times of a few hours, rather than one day, can be realized thus allowing less intense, but brighter proton beams.

6368 (DOE/ET/53088–683) **Envelope evolution of a laser pulse in an active medium.** Fisher, D.L.; Tajima, T.; Downer, M.C.; Siders, C.W. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Nov 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–683). Order Number DE95004402. Source: OSTI; NTIS; INIS; GPO Dep.

The authors show that the envelope velocity, v_{env}, of a short laser pulse can, via propagation in an active medium, be made less than, equal to, or even greater than c, the vacuum phase velocity of light. Simulation results, based on moving frame propagation equations coupling the laser pulse, active medium and plasma, are presented, as well as equations that determines the design value of super- and sub-luminous v_{env}. In this simulation the laser pulse evolves in time in a moving frame as opposed to their earlier work where the profile was fixed. The elimination of phase slippage and pump depletion effects in the laser wakefield accelerator is discussed as a particular application. Finally they discuss media properties necessary for an experimental realization of this technique.

6369 (FNAL/C–94/360) **Fermilab Tevatron and upgrade status.** Holmes, S.D.; Yarba, V.A. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410258–1: 14. conference on charged particle accelerators, Protvino (Russian Federation), 25-27 Oct 1994). Order Number DE95003501. Source: OSTI; NTIS; INIS; GPO Dep.

Performance and performance limitations of the Tevatron proton-antiproton collider at Fermilab will be discussed along with plans for improving the performance by a factor of five by the end of the decade. The centerpiece of this effort is the Fermilab Main Injector, a new 150 GeV synchrotron now under construction. Status of the project will be presented.

6370 (FNAL-TM–1907) **Proceedings of the workshop on future hadron facilities in the US.** Fermi National Accelerator Lab., Batavia, IL (United States); Universities Research Association, Batavia, IL (United States). [1994]. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9407128–Summs.: Workshop on future hadron facilities in the United States, Bloomington, IN (United States), 6-10 Jul 1994). Order Number DE95004513. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics on future hadron facilities: Workshop on future hadron facilities in the US; 30 x 30 TeV-summary report; A high luminosity, 2 x 2 TeV collider in the tevatron tunnel; magnets working group; cryogenics discussion; vacuum report; antiproton source production; injector working group; interaction region working group; lattice/beam dynamics working group; LEBT for high-luminosity colliders; some notes on long-range beam-beam effects for the 2TeV collider; synchrotron radiation masks for high energy proton accelerators. Emittance preservation in a proton synchrotron; beam-beam interaction effects on betatron tunes; analytic solutions for phase trombone modules; and chromatic corrections of RHIC when one or two insertions is at $B^* = 0.5m$.

6371 (FNAL-TM–1909) **Introduction to colliding beams at Fermilab.** Thompson, J. (Univ. of Maryland, College Park, MD (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95003387. Source: OSTI; NTIS; INIS; GPO Dep.

The Fermi National Accelerator Laboratory is currently the site of the world's highest center-of-mass energy proton-antiproton colliding beam accelerator, the Tevatron. The CDF and Dv detectors each envelop one of two luminous regions in the collider, and are thus wholly dependent on the accelerator for their success. The Tevatron's high operating energy, reliability, and record setting integrated luminosity have allowed both experiments to make world-class measurements and defined the region of physics that each can explore. The following sections are an overview of the highlights of the accelerator operation and are compiled from many sources. The major sources for each section are listed at the beginning of that section.

6372 (INIS-mf–14420(Pt.1.2.3), [pp. 8]) **Development of the next generation of powerful electron accelerators.** Kuksanov, N.K. (AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki); Korabelnikov, B.M.; Kosilov, M.R.; Prudnikov, V.V.; Salimov, R.A. International Atomic Energy Agency, Vienna (Austria); Institute of Nuclear Chemistry and Technology, Warsaw (Poland). [1994]. [240p.] (CONF-9305397–: IAEA final research co-ordination meeting on radiation processing of combustion flue gases, Zakopane (Poland), 24-28 May 1993). In *IAEA final research co-ordination meeting on radiation processing of combustion flue gases. Poland, Zakopane, 24-28 May, 1993. Pt.1.* Order Number DE95610863. Source: OSTI; NTIS; INIS.

Technical and exploitation parameters of powerful electron accelerators of new generation constructed in Budker Institute of Nuclear Physics SB RAS in Novosibirsk have been shown. Two types (200 kW and 500 kW) of such accelerators designated especially for industrial applications have been presented. 4 figs.

6373 (INIS-mf–14420(Pt.1.2.3), [pp. 9]) **Overview of Nissin high voltage's e-beam technologies.** Sakamoto, I. (Nissin - High Voltage Co. Ltd., Kyoto (Japan)); Mizusawa, K.; Taniguchi, S.; Hoshi, Y. International Atomic Energy Agency, Vienna (Austria); Institute of Nuclear Chemistry and Technology, Warsaw (Poland). [1994]. [240p.] (CONF-9305397–: IAEA final research co-ordination meeting on radiation processing of combustion flue gases, Zakopane (Poland), 24-28 May 1993). In *IAEA final research co-ordination meeting on radiation processing of combustion flue gases. Poland, Zakopane, 24-28 May, 1993. Pt.1.* Order Number DE95610863. Source: OSTI; NTIS; INIS.

The Nissin-High Voltage Co. Ltd. was establishes more than two decades ago as a specialized manufacturer of electron beam accelerators and has been engaged in the development of e-beam accelerators designed to melt a wide variety of customers of industrial and environmental applications. The current status of e-beam technologies at Nissin-High Voltage Co. Ltd. has been described and discussed as well as specific requirements for e-beam systems used for flue gas treatment have been presented.

6374 (INIS-mf–14422) **Accelerator facilities users' guide.** Walter, H.C. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Adrion, L.; Frosch, R.; Salzmann, M. (eds.). No corporate text available. Jul 1994. 106p. Order Number DE95611104. Source: OSTI; NTIS (US Sales Only); INIS.

In 1981 the "Green Book" of SIN was distributed, a User Handbook serving the needs of people already working at SIN as well as informing new users about our installations. An update of the Green Book is necessary because many beams have disappeared, been modified or added, and the installation has been upgraded in intensity and versatility quite considerably. The spectrum of users has shifted away from nuclear and particle physics; applications in medicine, solid state physics and materials science have gained in importance. This Users' Guide is intended to inform our users about the changes, and to interest potential new users in coming to PSI. (author) figs., tabs.

6375 (LA-UR–94-3785) **A debris free, electron beam driven, lithography source at 130 Å.** Fulton, R.D.; Abdallah, J.; Goldstein, J.C.; Jones, M.E.; Kilcrease, D.P.; Kinross-Wright, J.M.; Kong, S.H.; Nguyen, D.C. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract W-7405-ENG-36. (CONF-9409177–6: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95003687. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos and Grumman are cooperatively investigating a debris free source for EUV lithography. This source utilizes the predicted anomalous energy loss of a short pulse electron beam in a preformed plasma to heat and ionize the ions to a charge state where efficient radiation at 130Å occurs. Accelerators developed for the free electron laser program at Los Alamos are used as the electron bunch source. These accelerators use a laser driven photocathode to produce 15 psec electron bunches containing 4 nC of charge with an energy of 15.5 MeV. These micropulses are produced at a repetition rate of 108 MHz and continue for the length of the rf macropulse energizing the accelerator cavities, typically 1–10 μsec. The weakly ionized preformed plasma is created by purely classical collisional ionization caused by the initial few electron micropulses within the macropulse. When a critical electron density is reached, $n_e \simeq 1.6 \times 10^{15}/\tau^2$ cm^{-3}, where τ is the FWHM, in psec, of the electron bunch, the plasma responds collectively to the electron micropulse generating a large amplitude plasma wave. The plasma wave efficiently slows the high energy electron beam while heating the background plasma electrons. The initial electron population rapidly heats and then equilibrates with the bulk ion and electron populations in a few 10's of picoseconds. With neon as the dominant ionic species, an efficient filamentary radiator of line radiation near 130Å is created. A proof-of-principle experiment has been completed to demonstrate the anomalous energy loss process and bench-mark theoretical calculations at much lower densities appropriate to the existing 15 psec electron bunches.

6376 (LA-UR–94-3974) **Development of a RAMI model for LANSCE and high power APT accelerators.** Tallerico, P.J. Los Alamos National Lab., NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410218–5: Pulsed radio frequency sources for linear colliders, Long Island, NY (United States), 2-7 Oct 1994). Order Number DE95003670. Source: OSTI; NTIS; INIS; GPO Dep.

Assessment of the reliability, availability, maintainability and inspectability (RAMI) of all high power, high cost systems is important to justify and improve the cost effectiveness of these systems. For the very large (over 100 MW) accelerator systems associated with APT, a RAMI model is very valuable in guiding the design and allocation of resources. A RAMI model of an existing machine is also valuable, since machine improvement funds must be allocated to increase the availability by the largest amount. The authors have developed a RAMI model using the critical subsystems of the LANSCE accelerator and beam delivery complex as an example and to evaluate the effectiveness for estimating reliability and beam availability. LAMPF and LANSCE together provide most of the features required for the accelerator and beam delivery part of a high-power APT machine, but LANSCE is pulsed, rather than CW. This complex is capable of a 1-MW average power H^- beam, and it is the most powerful proton accelerator in the US built to date.

6377 (LBL–35533) **Post-accelerator issues at the IsoSpin Laboratory.** Chattopadhyay, S.; Nitschke, J.M. (eds.). Lawrence Berkeley Lab., CA (United States). May 1994. 198p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9310290–: Workshop on postacceleration issues at the IsoSpin Laboratory (ISL), Berkeley, CA (United States), 27-29 Oct 1993; CBP–075). Order Number DE95003417. Source: OSTI; NTIS; INIS; GPO Dep.

The workshop on "Post-Accelerator Issues at the Isospin Laboratory" was held at the Lawrence Berkeley Laboratory from October 27–29, 1993. It was sponsored by the Center for Beam Physics in the Accelerator and Fusion Research Division and the ISL Studies Group in the Nuclear Science Division. About forty scientists from around the world participated vigorously in this two and a half day workshop, (c.f. Agenda, Appendix D). Following various invited review talks from leading practitioners in the field on the first day, the workshop focussed around two working groups: (1) the Ion Source and Separators working group and (2) the Radio Frequency Quadrupoles and Linacs working group. The workshop closed with the two working groups summarizing and outlining the tasks for the future. This report documents the proceedings of the workshop and includes the invited review talks, the two summary talks from the working groups and individual contributions from the participants. It is a complete assemblage of state-of-the-art thinking on ion sources, low-β, low(q/A) accelerating structures, e.g. linacs and RFQS, isobar separators, phase-space matching, cyclotrons, etc., as relevant to radioactive beam facilities and the IsoSpin Laboratory. We regret to say that while the fascinating topic of superconducting low-velocity accelerator structure was covered by Dr. K. Shepard during the workshop, we can only reproduce the copies of the transparencies of his talk in the Appendix, since no written manuscript was available at the time of publication of this report. The individual report have been catologed separately elsewhere.

6378 (LBL-PUB–601) **Advanced Light Source report. Volume 7, No. 1.** Lawrence Berkeley Lab., CA (United States). Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003449. Source: OSTI; NTIS; GPO Dep.

The exceptional science already emerging from the user program at the ALS shows that the promises of "unique research opportunities" and "experiments not possible anywhere else" made at the inception of the ALS are indeed coming true. In less than a year of beamline operations, the ALS has produced numerous high-quality results and achieved an enviable level of performance. Since the beginning of 1994, the ALS has operated for 92% of its scheduled hours, an outstanding achievement for a new machine. The ALS' ability to deliver the brightest light in the world in the ultraviolet and soft x-ray regions of the spectrum has attracted a who's who of synchrotron research to the experiment floor. These users have produced a variety of scientifically significant results during the ALS' first year of operation, a few of which are highlighted in this article.

6379 (SLAC-PUB–6650) **Accelerator modeling system for the future.** Lee, M. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Cai, Y.; Tran, P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409258–2: Workshop on nonlinear dynamics in particle accelerators: theory and experiments, Arcidosso (Italy), 4-9 Sep 1994). Order Number DE95004284. Source: OSTI; NTIS; INIS; GPO Dep.

Many computer programs and a variety of models exist for the design of accelerator lattices and the correction of errors. Many physicists contributed to this work by developing codes to suit a variety of machines. At present, we are integrating some of these codes into a unified framework to design and control any type of machine. We will refer to this system of interactive accelerator design, control, and analysis codes as the All-In-One Modeling system (AIM). This paper will explore the utilities of AIM for future accelerator modeling and control. As an example, we will describe a procedure to produce both a linear and a nonlinear model for SPEAR.

4302 Beam Dynamics, Field Calculations, and Ion Optics

6380 (FNAL/C–94/356-E) **Neutrino optics.** Carey, D.C. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410229–2: 4. international conference on charged particle optics, Tsukuba (Japan), 3-6 Oct 1994). Order Number DE95004236. Source: OSTI; NTIS; INIS; GPO Dep.

Neutrinos are produced by the in-flight decay of π and k mesons. Neutrinos are uncharged and cannot be focused directly. However, the transverse momentum of the neutrino due to the decay is typically much smaller than the transverse momentum spread of the parent meson. The focusing of the meson beam will then significantly enhance the neutrino flux at a distant detector. Neutrino beams can effectively be focused in the same manner as other charged particle beams, by means of quadrupoles and bending magnets. The bending magnets also can serve to define the momentum of the neutrino beams. Alternatively, neutrino beams can be focused by the use of magnetic horns. Both systems are

described here. Proposed experiments with neutrinos to detect neutrino oscillations place the detector hundreds of kilometers away from the source. The flux of neutrinos through the detector then becomes very small. The calculation of the flux by conventional Monte Carlo or numerical integration techniques becomes prohibitively difficult. An alternate mathematical technique can be used to give results which are reliable to about 10%.

6381 (KEK-PROC–93-10, pp. 288-291) **Spectral analysis of electromagnetic field created by electron beam in the cylindrical waveguide.** Itoh, Hiroyasu (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Tomioka, Satoshi; Enoto, Takeaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

To examine the spectrum of the electromagnetic field created by micro-pulses of electron beams, we placed two reflective conductive plates in a cylindrical waveguide. We measured the spatial distributions of the resulting standing wave. Also we analyses the same configuration and obtains the spatial distributions. Furthermore we compared these two spectra in the frequency domain. (author).

6382 (KEK-PROC–93-10, pp. 292-295) **Exact solution of the transverse equation of motion for multibunched-beam dynamics.** Ogawa, Yujiro (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

An exact solution of the transverse equation of motion for multibunched-beam dynamics which is based on the rigid macroparticle model was obtained in a general form, where the betatron wave number and the beam energy both depend on position, i.e. the independent variable of the equation, in a certain manner. The result was compared with the numerical simulation to check its validity. By using this analytical solution, we might get better understanding of transverse wake-field effects in the case of high-current beam acceleration. (author).

6383 (SLAC-PUB–6727) **A fast tracking method using resonance basis Hamiltonians.** Irwin, J.; Chen, T.; Yan, Y.T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409258–1: Workshop on nonlinear dynamics in particle accelerators: theory and experiments, Arcidosso (Italy), 4-9 Sep 1994). Order Number DE95004292. Source: OSTI; NTIS; INIS; GPO Dep.

A resonance basis map is an important way of analyzing lattice properties in circular accelerators. A method is developed to do tracking with resonance basis maps. The speed of this method is faster than other map tracking methods, and can be dramatically increased by dropping insignificant resonance terms. This mapping method enables us to simulate and study the interplay between lattice nonlinearities and other effects such as the beam-beam interaction.

6384 (ANL/APS/TM–12) **1993 CAT workshop on beamline optical designs.** Argonne National Lab., IL (United States). Nov 1993. 298p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9307210–: 1993 CAT (Collaborative Access Team) workshop on beamline optical designs, Argonne, IL (United States), 26-27 Jul 1993). Order Number DE95004184. Source: OSTI; NTIS; INIS; GPO Dep.

An Advanced Photon Source (APS) Collaborative Access Team (CAT) Workshop on Beamline Optical Designs was held at Argonne National Laboratory on July 26–27, 1993. The goal of this workshop was to bring together experts from various synchrotron sources to provide status reports on crystal, reflecting, and polarizing optics as a baseline for discussions of issues facing optical designers for CAT beamlines at the APS. Speakers from the European Synchrotron Radiation Facility (ESRF), the University of Chicago, the National Synchrotron Light Source, and the University of Manchester (England) described single- and double-crystal monochromators, mirrors, glass capillaries, and polarizing optics. Following these presentations, the 90 participants divided into three working groups: Crystal Optics Design, Reflecting Optics, and Optics for Polarization Studies. This volume contains copies of the presentation materials from all speakers, summaries of the three working groups, and a "catalog" of various monochromator designs.

6385 (ANL/IPNS/CP–84859) **IPNS neutron scattering instrumentation: A – Existing and planned; B – Possibilities for IPNS upgrade, a 1-MW spallation source.** Brown, B.; Crawford, K. Argonne National Lab., IL (United States). Intense Pulsed Neutron Source (IPNS) Program. [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–17: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004119. Source: OSTI; NTIS; INIS; GPO Dep.

The Intense Pulsed Neutron Source (IPNS) is a pulsed spallation neutron source located at Argonne National Laboratory near Chicago, Illinois in the US. This facility is the outgrowth of a long line of pioneering work on pulsed spallation neutron sources begun at Argonne in the early 1970s. IPNS uses protons accelerated in the Rapid Cycling Synchrotron to produce neutrons via the spallation process (effectively a nuclear evaporation in which 10–50 neutrons are released per incident proton) in a heavy-element target. These neutrons are then moderated to produce spectra peaked at thermal or subthermal energies, and directed into beams which serve a variety of instruments. This paper discusses the diffractometers, various spectrometers, and reflectometers in existence and those planned for the upgrade of the IPNS.

6386 (FNAL/C–94/333) **Charged particle beam current monitoring tutorial.** Webber, R.C. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9410219–21: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95003379. Source: OSTI; NTIS; INIS; GPO Dep.

A tutorial presentation is made on topics related to the measurement of charged particle beam currents. The fundamental physics of electricity and magnetism pertinent to the problem is reviewed. The physics is presented with a stress on its interpretation from an electrical circuit theory point of view. The operation of devices including video pulse current transformers, direct current transformers, and gigahertz bandwidth wall current style transformers is described. Design examples are given for each of these types of devices. Sensitivity, frequency response, and physical environment are typical parameters which influence the design of these instruments in any particular application. Practical engineering considerations, potential pitfalls, and performance limitations are discussed.

6387 (FNAL/C–94/399) **Electron drift velocities of Ar-CO_2-CF_4 gas mixtures.** Markeloff, R. (Northern Illinois Univ., DeKalb, IL (United States). Dept. of Physics); Haggerty, H.; Shao, Y. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941061–11: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95004353. Source: OSTI; NTIS; INIS; GPO Dep.

The muon spectrometer for the D0 experiment at Fermi National Accelerator Laboratory uses proportional drift tubes filled with an Ar-CO_2-CF_4 gas mixture. Measurements of drift velocity as a function of electric field magnitude for 90%-5%-5% and 90%-4%-6% Ar-CO_2-CF_4 mixtures are presented, and our operational experiences with these gases at D0 is discussed.

6388 (FNAL-TM–1908) **A longitudinal bunch monitoring system using LabVIEW® and high-speed oscilloscopes.** Barsotti, E.L. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95003386. Source: OSTI; NTIS; INIS; GPO Dep.

A new longitudinal bunch monitoring system has been installed at Fermilab for the Tevatron and Main Ring. For each machine, a signal from a broadband wall current monitor is sampled and digitized by a high-speed oscilloscope. A Macintosh computer, running LabVIEW-based software, controls the scopes and CAMAC timing modules and analyzes the acquired data. The resulting bunch parameters are used for a variety of purposes, including Tevatron collider luminosity calculation and injection analysis. This paper examines the system in detail.

6389 (FNAL-TM–1910) **Procedure to determine the two channel timing measurement accuracy and precision of a digital oscilloscope.** Johnson, M.; Matulik, M. Fermi National Accelerator Lab., Batavia, IL (United States). 17 Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95004351. Source: OSTI; NTIS; INIS; GPO Dep.

The digital oscilloscope allows one to make numerous timing measurements, but just how good are those measurements? This document describes a procedure which can be used to determine the accuracy and precision to which a digital oscilloscope can make various two channel timing measurements.

6390 (JAERI-Data/Code–94-012) **Benchmark problems for intermediate and high energy accelerator shielding.** Nakashima, Hiroshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sakamoto, Yukio; Tanaka, Shun-ichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1994. 98p. Order Number DE95737270. Source: OSTI; NTIS; INIS.

Six kinds of benchmark problems were selected for evaluating the model codes and the nuclear data for the intermediate and high energy accelerator shielding by the Shielding Subcommittee in the Research Committee on Reactor Physics. The benchmark problems contain three kinds of neutron production data from thick targets due to proton, alpha and electron, and three kinds of shielding data for secondary neutron and photon generated by proton. Neutron and photoneutron reaction cross section data are also provided for neutrons up to 500 MeV and photons up to 300 MeV, respectively. (author).

6391 (KEK-PROC–93-10, pp. 296-298) **Off-line tests of superconducting resonators of the JAERI tandem booster.** Shibata, Michihiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ishii, Tetsuro; Takeuchi, Suehiro. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The JAERI tandem booster linac, which consists of 46 superconducting quarter wave resonators, is under construction. Off-line tests for resonators were performed. Accelerating field levels of 7MV/m were obtained at an rf input of 4W with most resonators. A maximum field level of 12.7MV/m was obtained. The Q-value was degraded when resonators were cooled down slowly around a temperature of 120K. We investigated this phenomenon by changing the cooling rate. (author).

6392 (KEK-PROC–93-10, pp. 299-303) **Q-degradation due to hydrogen in high pure niobium cavities.** Saito, Kenji (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kneisel, P. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

A high pure niobium material with a high thermal conductivity at the liquid helium temperature has been used for superconducting cavities to achieve a higher field gradient overcoming thermal instability. However, it has resulted in a problem four years ago. When the high pure niobium cavities are cooled down slowly around 100K, they suffer a large Q-degradation due to hydrogen picked up during chemical polishing. This phenomenon can be explained by a character of magnetic weak superconductor generated during the cooling down. In this paper we report the experimental phenomenon and discuss the theoretical explanation on this Q-degradation. (author).

6393 (KEK-PROC–93-10, pp. 304-308) **In-house L-band niobium single cell cavities at KEK.** Inoue, Hitoshi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kobayashi, Yoshiharu; Funahashi, Yoshisato; Koizumi, Susumu; Saito, Kenji; Noguchi, Shuichi; Kako, Eiji; Shishido, Toshio. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

For the TESLA (TeV Energy Superconducting Linear Accelerator) as an energy frontier accelerator of the next generation improving the performance of the niobium superconducting cavities is the most important issue and much reduction of fabrication cost of cavities is another key. Since manufacturing of niobium material requires hard techniques due to the easily oxidizable metal, fabrication of niobium cavities has been conducted in only companies providing enough equipments in Japan. KEK has accumulated the fabrication technics such as forming method by deep drawing, trimming, centering of beam tubes, electron beam welding and measurement of manufacturing error so on. We made in-house L-band single cell cavities using these technologies. In this paper we present these manufacturing of the niobium cavities and estimate the fabrication cost as exactly as possible. The manufacturing error is also described. (author).

6394 (KEK-PROC–93-10, pp. 309-312) **The research for surface treatment of cavities aiming at higher accelerating field.** Suzuki, Takafusa (Nomura Techno Research, Co. Ltd. Osaka (Japan)); Ikeda, Tokumi; Saito, Kenji; Higo, Toshiyasu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Requirement of the surface treatment for complex structures as an accelerator has become stronger in recent years. The research and development for surfaces treatment of copper have been studied in order to realize smooth and clean surface of cavities. Three kinds of treatment methods were tested here. One is an electropolishing (EP), and the others are mixed acid and special acid (articles on sale) for chemical polishing. Wave guides shaped by WIRE-CUT were used for the test, and its surface roughness was about 10μm Rz. Three methods were compared in metal removal rate and surface roughness. Good performance was obtained in both EP and special acid. (author).

6395 (KEK-PROC–93-10, pp. 313-317) **Research and development of an ultra clean surface for RF cavities.** Miwa, Hajime (Nomura Techno Research, Co. Ltd., Osaka (Japan)); Ikeda, Tokumi; Suzuki, Takafusa; Kurosawa, Kiyosi; Kako, Eiji; Noguchi, Shuichi; Saito, Kenji; Kneisel, P. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Suppression of field emission is essentially important in order to attain higher accelerating gradients. Therefore, elimination of residual dust particles on the inner surface of RF cavities is necessary. Surface of a niobium cavity was simulated in silicon wafers, and analysis of dust particles was performed by a particle counter used for semiconductor industries. Experimental results in various surface treatments and applications to niobium cavities are described in this paper. (author).

6396 (KEK-PROC–93-10, pp. 318-322) **Development of high purity niobium material for superconducting cavities.** Umezawa, Hiroaki (Tokyo Denkai Co., Ltd. (Japan)); Takeuchi, Koichi; Sakita, Kohei; Suzuki, Takafusa; Saito, Kenji; Noguchi, Shuichi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

For the superconducting niobium cavities, issues of thermal quench and field emission have to be solved to achieve a high field gradient (>25MV/m) for TESLA (TeV Energy Superconducting Linear Accelerator). In order to overcome the quench, upgrading of thermal conductivity of niobium material at the low temperature is very important. On the reduction of the field emission not only dust particles but also defect, impurity and inhomogeneity should be considered. Therefore development of high purity niobium material is very important to solve these issues. This paper describes the our latest R and D for high purity niobium material. (author).

6397 (KEK-PROC–93-10, pp. 323-326) **Manufacturing of the L band 9-cell niobium cavity.** Matsuoka, Masanori (Mitsubishi Heavy Industries Ltd., Kobe (Japan). Kobe Shipyard and Machinery Works); Ohkubo, Kohichi; Yamanaka, Toshiyuki; Kako, Eiji; Saito, Kenji; Shishido, Toshio; Ono, Masaaki; Noguchi, Shuichi. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Since 1990, L-band niobium superconducting cavities have been developed with collaboration between our company and National Laboratory for High Energy Physics (KEK). The manufacturing procedure and the performance of 9-cell superconducting cavity are presented. The maximum accelerating gradient of 12 MV/m was attained in a cold test. (author).

6398 (KEK-PROC–93-10, pp. 327-331) **High field tests of 1.3 GHz niobium superconducting cavities.** Kako, Eiji (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Noguchi, Shuichi; Ono, Masaaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Four single-cell cavities prepared by various surface treatments have been tested repeatedly since 1991. A maximum accelerating gradient of 25.1 MV/m with a high Q_0 value of $\approx 10^{10}$ was successfully achieved after heat treatment at 1400degC. A temperature mapping system with a high thermal sensitivity under superfluid helium was developed to understand phenomena limiting a maximum accelerating gradient. The cavity performances and the phenomena at high fields are reported in this paper. (author).

6399 (KEK-PROC–93-10, pp. 332-334) **The concept of parallel input/output processing for an electron linac.** Emoto, Takashi (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The instrumentation of and the control system for the PNC 10 MeV CW electron linac are described. A new concept of parallel input/output processing for the linac has been introduced. It is based on a substantial number of input/output processors(IOP) using beam control and diagnostics. The flexibility and simplicity of hardware/software are significant advantages with this scheme. (author).

6400 (KEK-PROC–93-10, pp. 335-339) **PC-based device-layer control system in the PF linac.** Abe, Isamu (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Nakahara, Kazuo; Mutoh, Masakatsu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

It has been tried to replace the device-layer mini-computer connected to CAMAC, which has been used more than 10 years in the Photon Factory 2.5 GeV e^-/e^+ linac, with recent powerful networked PCs. The processing speed has been improved at a low cost. The OOA(Object Oriented Analysis) is introduced in this system to make standard objects in the accelerator domain. (author).

6401 (KEK-PROC–93-10, pp. 340-342) **Upgrade of GUI for linac control.** Oonuma, Tadahiro (Tohoku Univ., Sendai (Japan). Lab. of Nuclear Science); Shibasaki, Yoshinobu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

We are now upgrading GUI(Graphical User Interface) of the control system at Tohoku Linac. This system uses Personal Computer (DECpc466D2LP-66MHz) and Visual Basic which makes coding GUI easy and simple. The first results of this system are presented. (author).

6402 (KEK-PROC–93-10, pp. 351-355) **New control system for the KEK-linac.** Kamikubota, N. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Furukawa, K.; Nakahara, K.; Abe, I.; Akimoto, H. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

New control system for the KEK-Linac has been developed. Unix-based workstations and VME-bus computers are introduced. They are inter-connected with an Ethernet, which is used as a high-speed data-exchange network. New system will start the operation after October 1993. (author).

6403 (KEK-PROC–93-10, pp. 356-359) **Control system architecture of KEK 2.5 GeV linac.** Furukawa, Kazuro (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kamikubota, Norihiko; Abe, Isamu; Nakahara, Kazuo. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The control system of KEK 2.5 GeV linac is being rejuvenated. The main part of the hardware will be replaced and the architecture of its software is upgraded as well. System software has been developed to achieve new control scheme as well as old one. Since we invested in operator's console system which uses old control messages, we will continue support it. The new control scheme is based on the object oriented design of accelerator controls. It will enable the flexible and robust linac controls. (author).

6404 (KEK-PROC–93-10, pp. 360-362) **Operator interface using Tk widget. 2.** Furukawa, Kazuro (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Kamikubota, Norihiko; Kusano, Shirou. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

As accelerators got larger complex, it has become difficult to operate and understand whole accelerator. It is important to make effort to reduce information and to build easily configurable user-interface for operators. We have tested a building tool for graphical-user-interface called Tk in our Kek Linac control system. Tk is very efficient to develop user-interface for accelerator operation. The possible usage of Tk in our control system is described as well as its feature and performance. (author).

6405 (LA-UR–94-3350) **Noninterceptive beam energy measurements in line D of the Los Alamos Meson Physics Facility.** Gilpatrick, J.D.; Carter, H.; Plum, M.; Power, J.F.; Rose, C.R.; Shurter, R.B. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410219–22: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95003711. Source: OSTI; NTIS; INIS; GPO Dep.

Several members of the Accelerator and Operations Technology (AOT) division beam-diagnostics team performed time-of-flight (TOF) beam-energy measurements in line D of the Los Alamos Meson Physics Facility (LAMPF) using developmental beam time. These measurements provided information for a final design of an on-line beam energy measurement. The following paper discusses these measurements and how they apply to the final beam energy measurement design.

6406 (LA-UR–94-4040) **The Manuel Lujan Jr. Neutron Scattering Center.** Goldstone, J.A. (Los Alamos National Lab., NM (United States). Manuel Lujan Jr. Neutron Scattering Center). Los Alamos National Lab., NM (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–8: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003678. Source: OSTI; NTIS; INIS; GPO Dep.

High in the northcentral mountains of Los Alamos, New Mexico, is the Manuel Lujan Jr. Neutron Scattering Center (LANSCE), a pulsed-spallation neutron source located at Los Alamos National Laboratory. At LANSCE, neutrons are produced by spallation when a pulsed 800-MeV proton beam impinges on a tungsten target. The proton pulses are provided by a linear accelerator and an associated Proton Storage Ring (PSR), which alters the intensity, time structure, and repetition rate of the pulses. In October 1986, LANSCE was designated a national user facility, with a formal user program initiated in 1988. In July 1989, the LANSCE facility was dedicated as the Manuel Lujan Jr. Neutron Scattering Center in honor of the long-term Congressman from New Mexico. At present, the PSR operates with a proton pulse width of 0.27 μs at 20 Hz and 80 μA, attaining the highest peak neutron flux in the world and close to its goal of 100 μA, which would yield a peak thermal neutron flux of 10^{16} n/cm^{-2}s^{-1}. This paper discusses the target/moderator/reflector shield system, the LANSCE instruments, the facility improvement projects, and user programs.

6407 (LA-UR–94-4061) **Experimental and theoretical development towards a 500 MW, one-microsecond, L-band relativistic klystron amplifier.** Haynes, W.B.; Fazio, M.V.; Carlsten, B.E.; Stringfield, R.M. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410218–4: Pulsed radio frequency sources for linear colliders, Long Island, NY (United States), 2-7 Oct 1994). Order Number DE95003682. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This paper describes the experimental development of a long pulse, high current, annular beam relativistic klystron amplifier. The desired performance parameters are 1 GW output power and 1 μs pulse length with an operating frequency of 1.3 GHz. The electron beam voltage and current are nominally 600 kV and 5 kA. Peak powers approaching 500 MW have been achieved in pulses of 1 μs nominal baseline-to-baseline duration. The half power pulse width is 0.5 μs. These pulses contain an energy of about 160 J. The design of this class of tube presents some unique challenges, particularly in the output cavity. The output cavity must exhibit a very low gap shunt impedance in order to obtain reasonable conversion efficiency from the low impedance modulated electron beam to microwave power, while still maintaining a reasonable loaded Q for mode purity. The physics of this device is dominated by space charge effects which strongly impact the design. Current experimental results and theoretical design considerations for this class of tube, and scaling to higher frequency operation, suitable for the Next Linear Collider are discussed.

6408 (LA-UR–94-4118) **Optical and x-ray imaging of electron beams using synchrotron emission.** Wilke, M.D. Los Alamos National Lab., NM (United States). [1994]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410219–20: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95003637. Source: OSTI; NTIS; INIS; GPO Dep.

In the case of very low emittance electron and positron storage ring beams, it is impossible to make intrusive measurements of beam properties without increasing the emittance and possibly disrupting the beam. In cases where electron or positron beams have high average power densities (such as free electron laser linacs), intrusive probes such as wires and optical transition radiation screens or Cherenkov emitting screens can be easily damaged or destroyed. The optical and x-ray emissions from the bends in the storage rings and often from linac bending magnets can be used to image the beam profile to obtain emittance information about the beam. The techniques, advantages and limitations of using both optical and x-ray synchrotron emission to measure beam properties are discussed and the possibility of single bunch imaging is considered. The properties of suitable imagers and converters such as phosphors are described. Examples of previous, existing and planned applications are given where available, including a pinhole imaging system currently being designed for the Advanced Photon Source at Argonne National Laboratory.

6409 (LBL–35476-Exc.) **Superconducting magnets.** Lawrence Berkeley Lab., CA (United States). Aug 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003813. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics on superconducting magnets: D19B and -C: The next steps for a record-setting magnet; D20: The push beyond 10 T: Beyond D20: Speculations on the 16-T regime; other advanced magnets for accelerators; spinoff applications; APC materials development; cable and cabling-machine development; and high-$T_c$superconductor at low temperature.

6410 (LBL–35822) **Proceedings of the conference on computing in high energy physics '94.** Loken, S.C. (ed.). Lawrence Berkeley Lab., CA (United States). [1994]. 532p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940492–: Meeting on computing in high-energy physics, San Francisco, CA (United States), 21-27 Apr 1994). Order Number DE95004442. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains papers on the following topics: Triggering, data acquisition, online and control systems; hardware architectures; networks and interconnections; data handling and storage systems; software methodologies, languages and tools; user interfaces and visualization; computation; and information systems and multimedia. The individual papers have been indexed and cataloged elsewhere.

6411 (LBL–36232) **Relativistic-klystron two-beam-accelerator as a power source for a 1 TeV next linear collider: A systems study.** Yu, S. (Lawrence Berkeley Lab., CA (United States)); Goffeney, N.; Deadrick, F. Lawrence Berkeley Lab., CA (United States). Oct 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9408125–43: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95003425. Source: OSTI; NTIS; INIS; GPO Dep.

A physics, engineering, and costing study has been conducted to explore the feasibility of a relativistic-klystron two-beam-accelerator system as a power source candidate for a 1 TeV linear collider. We present a point design example which has acceptable transverse and longitudinal beam stability properties. Preliminary "bottom-up" cost estimate yields the full power source system at less than 1 billion dollars. The overall efficiency for rf production is estimated to be 36%.

6412 (LBL–36347) **Proceedings of the workshop on ion source issues relevant to a pulsed spallation neutron source: Part 2 workshop presentations.** Schroeder, L.; Leung, Ka-Ngo; Alonso, J. (eds.). Lawrence Berkeley Lab., CA (United States). Oct 1994. 531p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9410233–Pt.2:

Workshop on ion source issues relevant to a pulsed spallation neutron source, Berkeley, CA (United States), 24-26 Oct 1994). Order Number DE95004818. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Lawrence Berkeley Laboratory Pulsed Spallation Source study, this Workshop was convened to address ion-source technology's present status with respect to the next-generation Pulsed Spallation Source in the 1-5 MW range for the neutron scattering community. Considerations of Low Energy Beam Transport (LEBT) parameters and designs were included in the discussions throughout the Workshop. Ion-source requirements and actually-achieved performances were assessed, resulting in a determination of research and development requirements to bridge the gap. Part 1 of these Proceedings summarizes the Workshop; Part 2 contains viewgraphs of Workshop presentations.

6413 (SLAC-PUB–6624) **Higher order mode damping for a detuned structure.** Kroll, N. (California Univ., San Diego, La Jolla, CA (United States). Dept. of Physics); Thompson, K.; Bane, K.; Ko, K.; Miller, R.; Ruth, R.; Gluckstern, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States); California Univ., San Diego, La Jolla, CA (United States). Dept. of Physics. Aug 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; FG03-93ER40759. (CONF-9408125–44: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95004283. Source: OSTI; NTIS; INIS; GPO Dep.

We report in this paper the current status of our investigation of the possibility of suppressing the wake reappearance by providing relatively weak damping via the vacuum manifolds. The four vacuum manifolds running the length of the structure also function as multimode waveguides which serve to drain power from the HOM's through the large coupling slots located in each cell, except, as discussed later, for a few at each end of the manifolds.

6414 (SLAC-PUB–6656) **Performance of the SLD Central Drift Chamber.** Hildreth, M.D. (and others); Junk, T.R.; Markiewicz, T.W. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-941061–8: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95004285. Source: OSTI; NTIS; INIS; GPO Dep.

We report for the first time on the performance of the SLD Central Drift Chamber (CDC) at SLC, which has been recording data since 1992. The low mass of the chamber and the use of a gas characterized by both a low drift velocity and low diffusion constant help to minimize the drift-distance measurement errors. We describe some of the calibrations and corrections applied to the data, and report on the resolutions achieved thus far. We measure an intrinsic drift resolution of 55-110 μm in the region of uniform field. Analysis of the full drift-pulse waveform allows for efficient double-hit resolution of about 1 mm. Momentum resolution is characterized by the formula $(dp_t/p_t^2)^2 = 0.0050^2 + (0.010/p_t)^2$. Used in conjunction with the SLD vertex detector, the CDC permits measurements of impact parameters of high-momentum tracks to the level of 10 μm in the r-ϕ plane and 36 μm the r-z plane. A resolution of 6.4% is achieved in the measurement of dE/dx for the electrons in Bhabha scattering events.

6415 (SLAC-PUB–6660) **Manifold damping of the NLC detuned accelerating structure.** Kroll, N. (California Univ., San Diego, La Jolla, CA (United States)); Thompson, K.; Bane, K.; Ko, K.; Miller, R.; Ruth, R.; Gluckstern, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; FG03-93ER40759. (CONF-940681–4: Advanced accelerator concepts workshop, Lake Geneva, WI (United States), 13-18 Jun 1994). Order Number DE95004286. Source: OSTI; NTIS; INIS; GPO Dep.

In order to investigate the reappearance of the HOM wakefield of a detuned accelerator structure and relax tolerance requirements, we propose to provide low level damping by coupling all cavities to several identical and symmetrically located waveguides (manifolds) which run parallel to each accelerator structure and are terminated at each end by matched loads. The waveguides are designed such that all modes which couple to the acceleration mode are non-propagating at the acceleration mode frequency. Hence the coupling irises can be designed to provide large coupling to higher frequency modes without damping the acceleration mode. Because the higher order modes are detuned, they are localized and have a broad spectrum of phase velocities of both signs. They are therefore capable of coupling effectively to all propagating modes in the waveguides. Methods of analyzing and results obtained for the very complex system of modes in the accelerating structure and manifolds are presented.

6416 (SLAC-PUB–6675) **Operation and performance of a longitudinal feedback system using digital signal processing.** Teytelman, D. (and others); Fox, J.; Hindi, H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). 22 Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (LBL–36174; CONF-9410219–19: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95004288. Source: OSTI; NTIS; INIS; GPO Dep.

A programmable longitudinal feedback system using a parallel array of AT&T 1610 digital signal processors has been developed as a component of the PEP-II R&D program. This system has been installed at the Advanced Light Source (LBL) and implements full speed bunch by bunch signal processing for storage rings with bunch spacing of 4ns. Open and closed loop results showing the action of the feedback system are presented, and the system is shown to damp coupled-bunch instabilities in the ALS. A unified PC-based software environment for the feedback system operation is also described.

6417 (SLAC-PUB–6689) **A ppM-focused klystron at X-band with a travelling-wave output structure.** Eppley, K.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9410218–3: Pulsed radio frequency sources for linear colliders, Long Island, NY (United States), 2-7 Oct 1994). Order Number DE95004289. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed algorithms for designing disk-loaded travelling-wave output structures for X-band klystrons to be used in the SLAC NLC. We use either a four- or five-cell structure in a $\pi/2$ mode. The disk radii are tapered to produce an approximately constant gradient. The matching calculation is not performed on the tapered structure, but rather on a coupler whose input and output cells are the same as the final cell of the tapered structure, and whose interior cells are the same as the penultimate cell in the tapered structure. 2-D calculations using CONDOR model the waveguide as a radial transmission line of adjustable impedance. 3-D calculations with MAFIA model the actual rectangular waveguide and coupling slot. A good match is obtained by adjusting the impedance of the final cell. In 3D, this requires varying both the radius of the cell and the width of the aperture. When the output cell with the best match is inserted in the tapered structure, we obtain excellent cold-test agreement between the 2-D and 3-D models. We use hot-test simulations with CONDOR to design a structure with maximum efficiency and minimum surface fields. We have designed circuits at 11.424 GHz for different perveances. At 440 kV, microperveance 1.2, we calculated 81 MW, 53 percent efficiency, with peak surface field 76 MV/m. A microperveance 0.6 design was done using a ppM stack for focusing. At 470 kV, 193 amps, we calculated 58.7 MW, 64.7 percent efficiency, peak surface field 62.3 MV/m. At 500 kV, 212 amps, we calculated 67.1 MW, 63.3 percent efficiency, peak surface field 66.0 MV/m.

6418 (ANL/APS/TB–19) **A finite element analysis of room temperature silicon crystals for the Advanced Photon Source bending-magnet and insertion-device beams.** Assoufid, L.; Lee, W.K.; Mills, D.M. Argonne National Lab., IL (United States). Advanced Photon Source Accelerator Systems Div. Aug 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract W-31109-ENG-38. Order Number DE95004343. Source: OSTI; NTIS; INIS; GPO Dep.

The third generation of synchrotron radiation sources, such as the Advanced Photon Source (APS), will provide users with a high brilliance x-ray beam with high power and power densities. In many cases, the first optical component to intercept the x-ray beam is a silicon-crystal monochromator. Due to extreme heat loading, the photon throughput and brilliance will be severely degraded if the monochromator is not properly designed (or cooled). This document describes a series of finite element analyses performed on room temperature silicon for the three standard APS sources, namely, the bending magnet, Wiggler A, and Undulator A. The modeling is performed with the silicon cooled directly with water or liquid gallium through rectangular channels. The temperature distributions and thermally induced deformations are presented.

6419 (ANL/XFD/CP–82942) **Design of high heat load white-beam slits for wiggler/undulator beamlines at the Advanced Photon Source.** Shu, D.; Tcheskidov, V.; Nian, T.; Haeffner, D.R.; Alp, E.E.; Ryding, D.; Collins, J.; Li, Y.; Kuzay, T.M. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–41: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004136. Source: OSTI; NTIS; INIS; GPO Dep.

A set of horizontal and vertical white-beam slits has been designed for the Advanced Photon Source wiggler/undulator beamlines at Argonne National Laboratory. While this slit set can handle the high heat flux from on e APS undulator source, it has large enough aperture to be compatible with a wiggler source also. A grazing-incidence, knife-edge configuration has been used in the design to eliminate downstream X-ray scattering. Enhanced heat transfer technology has been used in the water-cooling system. A unique stepping parallelogram driving structure provides precise vertical slit motion with large optical aperture. The full design detail is presented in this paper.

6420 (ANL/XFD/CP–82943) **Beamline standard component designs for the Advanced Photon Source.** Shu, D.; Barraza, J.; Brite, C.; Chang, J.; Sanchez, T.; Tcheskidov, V.; Kuzay, T.M. Argonne National Lab., IL (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–42: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004135. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) has initiated a design standardization and modularization activity for the APS synchrotron radiation beamline components. These standard components are included in components library, sub-components library and experimental station library. This paper briefly describes these standard components using both technical specifications and side view drawings.

6421 (ANL/XFD/CP–82944) **A double-multilayer monochromator using a modular design for the Advanced Photon Source.** Shu, D.; Yun, W.; Lai, B.; Barraza, J.; Kuzay, T.M. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–43: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004134. Source: OSTI; NTIS; INIS; GPO Dep.

A novel double-multilayer monochromator has been designed for the Advanced Photon Source X-ray undulator beamline at Argonne National Laboratory. The monochromator consists of two ultra high-vacuum (UHV) compatible modular vessels, each with a sine-bar driving structure and a water-cooled multilayer holder. A high precision Y-Z stage is used to provide compensating motion for the second multilayer from outside the vacuum chamber so that the monochromator can fix the output monochromatic beam direction and angle during the energy scan in a narrow range. The design details for this monochromator are presented in this paper.

6422 (ANL/XFD/CP–82945) **Precision white-beam slit design for high power density x-ray undulator beamlines at the Advanced Photon Source.** Shu, D. (and others); Brite, C.; Nian, T. Argonne National Lab., IL (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–44: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004133. Source: OSTI; NTIS; INIS; GPO Dep.

A set of precision horizontal and vertical white-beam slits has been designed for the Advanced Photon Source (APS) X-ray undulator beamlines at Argonne National Laboratory. There are several new design concepts applied in this slit set, including: grazing-incidence knife-edge configuration to minimize the scattering of X-rays downstream, enhanced heat transfer tubing to provide water cooling, and a second slit to eliminate the thermal distortion on the slit knife edge. The novel aspect of this design is the use of two L-shaped knife-edge assemblies, which are manipulated by two precision X-Z stepping linear actuators. The principal and structural details of the design for this slit set are presented in this paper.

6423 (ANL/XFD/CP–82946) **Explosive bonding and its application in the Advanced Photon Source front-end and beamline components design.** Shu, D. (Argonne National Lab., IL (United States). Experimental Facilities Div.); Li, Y.; Ryding, D.; Kuzay, T.M.; Brasher, D. Argonne National Lab., IL (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–45: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004132. Source: OSTI; NTIS; INIS; GPO Dep.

Explosive bonding is a bonding method in which the controlled energy of a detonating explosive is used to create a metallurgical bonding between two or more similar or dissimilar materials. Since 1991, a number of explosive-bonding joints have been designed for high-thermal-load ultrahigh-vacuum (UHV) compatible components in the Advanced Photon Source. A series of standardized explosive bonded joint units has also been designed and tested, such as: oxygen-free copper (OFHC) to stainless-steel vacuum joints for slits and shutters, GlidCop to stainless-steel vacuum joints for fixed masks, and GlidCop to OFHC thermal and mechanical joints for shutter face-plates, etc. The design and test results for the explosive bonding units to be used in the Advanced Photon Source front ends and beamlines will be discussed in this paper.

6424 (BNL–60991) **The large superconducting solenoids for the g-2 muon storage ring.** Bunce, G. (and others); Cullen, J.; Danby, G. Brookhaven National Lab., Upton, NY (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941013–17: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95003958. Source: OSTI; NTIS; INIS; GPO Dep.

The g-2 muon storage ring at Brookhaven National Laboratory consists of four large superconducting solenoids. The two outer solenoids, which are 15.1 meters in diameter, share a common cryostat. The two inner solenoids, which are 13.4 meters in diameter, are in separate cryostats. The two 24 turn inner solenoids are operated at an opposite polarity from the two 24 turn outer solenoids. This generates a dipole field between the inner and outer solenoids. The flux between the solenoids is returned through a C shaped iron return yoke that also shapes the dipole field. The integrated field around the 14 meter diameter storage ring must be good to about 1 part in one million over the 90 mm dia. circular cross section where the muons are stored, averaged over the azimuth. When the four solenoids carry their 5300 A design current, the field in the 18 centimeter gap between the poles is 1.45 T. When the solenoid operates at its design current 5.5 MJ is stored between the poles. The solenoids were wound on site at Brookhaven National Laboratory. The cryostats were built around the solenoid windings which are indirectly cooled using two-phase helium.

6425 (JAERI-Research–94-021) **Experiment and simulation of an electron/positron convertor for SPring-8.** Mizuno, Akihiko (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Suzuki,

Shinsuke; Yoshikawa, Hiroshi; Hori, Toshihiko; Yanagida, Kenichi; Yokomizo, Hideaki. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 56p. (In Japanese). Order Number DE95737275. Source: OSTI; NTIS; INIS.

In the SPring-8, positron beam will be used for increasing beam-lifetime in the Storage-ring. An electron/positron convertor will be installed in the middle of the Linac. For designing the convertor, experiments of positron generation and focusing were carried out with a test apparatus which was mounted in the beam-line of the JAERI-Linac. And we had been also developing a simulation code for the convertor. Simulation was already reported in JAERI-M 93-030, so this paper shows experiment results, and comparison between experiment and simulation. The experiment data are qualitatively coincident with that of simulation data. So this simulation code turned out to be available for designing the convertor. (author).

6426 (JAERI-Research–94-029) **Calculation of thermal deformations in water-cooled monochromator crystals.** Nakamura, Ario (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Hashimoto, Shinya; Motohashi, Haruhiko. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1994. 59p. (In Japanese). Order Number DE95737269. Source: OSTI; NTIS; INIS.

Through calculation of temperature distribution and thermal deformation of monochromators, optical degradation by the heat loads in SPring-8 have been discussed. Cooling experiments were made on three models of copper structures with the JAERI Electron Beam Irradiation Stand (JEBIS) and the results were used to estimate heat transfer coefficients in the models. The heat transfer coefficients have been adopted to simulate heating processes on silicon models of the same structures as the copper models, for which radiations from the SPring-8 bending magnet and the JAERI prototype undulator (WPH-33J) were considered. It has been concluded that, in the case of bending magnet (with power density of 0.27[MW/m^2] on monochromator surface), the temperature at the surface center reaches about 30[degC] from the initial temperature of 27[degC] in all the models. In the case of WPH-33J (with power density of 8.2[MW/m^2]), the temperature reaches about 200 to 280[degC] depending on the models. The radiation from WPH-33J yields slope errors bigger than the Darwin's width(23[μrad]). (author).

6427 (KEK-PROC–93-10, pp. 285-287) **Experiment on a 2-m accelerator section with a resonant ring.** Ohgoe, Takao (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Enomoto, Atsushi; Sato, Isamu. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

Acceleration using a resonant ring was tested for the TRISTAN-II (B-Factory) project. Feeding an input rf-power of about 30MW into an existing 2-m accelerator section, an energy of 54.1MeV was obtained. The average acceleration field reached 28.6MV/m, and the voltage multiplication factor with the resonant ring was about 1.4. (author).

6428 (KEK-PROC–93-10, pp. 346-350) **OS9 device driver in C.** Tamezane, Kenji (JAERI-RIKEN SPring-8 Project Team, Tokyo (Japan)); Sakaki, Hironao; Kodera, Masahiko; Yoshikawa, Hiroshi; Suzuki, Shinsuke; Yanagida, Kenichi; Mizuno, Akihiko; Hori, Toshihiko; Yokomizo, Hideaki. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Aug 1993. (In Japanese). (CONF-9307187–: 18. linear accelerator meeting, Tsukuba (Japan), 21-23 Jul 1993). In *Proceedings of the 18th linear accelerator meeting in Japan.* 471p. Order Number DE94777550. Source: OSTI; NTIS; INIS.

The injector accelerators of SPring-8, 1 GeV linac and 8 GeV synchrotron, have distributed control systems using network and many VME computers. These are having many points must be modified after the facility is completed, and the system should be adapted to many requirements of users in a short time and low cost. For this purpose, the concept of object oriented programming(OOP) is inevitable to build up the software. We rewrite device drivers in C to get flexibility, transparency and ease of maintenance. Flexibility and transparency of device access contribute to good achievement of OOP control system. In this paper, the know-how the making device drivers in C and how to combine the C module with the assembler module are described. (author).

6429 (LBL–36279) **The LBL Advanced Light Source (ALS) transverse coupled-bunch feedback system: Recent commissioning results.** Barry, W.; Byrd, J.; Corlett, J. Lawrence Berkeley Lab., CA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9410219–18: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95003424. Source: OSTI; NTIS; INIS; GPO Dep.

The ALS transverse coupled-bunch feedback system is described along with some recent commissioning results. Results presented include transfer function measurements, demonstrations of multi-bunch damping, and demonstrations of simultaneous transverse and longitudinal systems operation.

6430 (SLAC-PUB–6714) **Status of the PEP-II asymmetric B-Factory.** Mattison, T.S. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Nov 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ; AC03-76SF00515 ; AC03-81ER40050 ; AS03-76ER70285 ; W-7405-ENG-48. (CONF-940816–55: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004291. Source: OSTI; NTIS; INIS; GPO Dep.

The PEP-II project is an e^+e^- storage ring complex with unequal energy beams to study CP violation in the B meson system. High luminosity requires a large number of bunches and a low value of beta at the collision point. The high beam current requires advances in vacuum chambers, damped RF cavities, and feedback systems. Machine elements inside the detector are required to achieve low beta values and magnetic separation.

44 INSTRUMENTATION

6431 (SAND–94-2404) **Primary standards laboratory report, 1st half 1994.** Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95003987. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories operates the Primary Standards Laboratory for the Department of Energy, Albuquerque Operations Office (DOE/AL). This report summarizes metrology activities that received emphasis in the first half of 1994 and provides information pertinent to the operation of the DOE/AL system-wide Standards and Calibration Program.

6432 (ANL/PHY/CP–84855) **Low-energy nuclear physics with high-segmentation silicon arrays.** Betts, R.R. (Argonne National Lab., IL (United States). Physics Div.). Argonne National Lab., IL (United States). Physics Div. [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409239–2: 29. Zakopane school of physics, Zakopane (Poland), 5-14 Sep 1994). Order Number DE95004118. Source: OSTI; NTIS; INIS; GPO Dep.

A brief history is given of silicon detectors leading up to the development of ion-implanted strip detectors. Two examples of their use in low energy nuclear physics are discussed; the search for exotic alpha-chain states in ^{24}Mg and studies of anomalous positron-electron pairs produced in collisions of very heavy ions.

6433 (BNL–61058) **Properties of melt-grown ZnSe solid-state radiation detectors.** Eissler, E.E. (II-VI Inc., Saxonburg, PA (United States)); Lynn, K.G. Brookhaven National Lab., Upton, NY (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941061–10: Nuclear science symposium: medical imaging

conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95003964. Source: OSTI; NTIS; INIS; GPO Dep.

Zinc Selenide (ZnSe) crystals grown using the High Pressure Bridgman (HPB) technique were used to fabricate solid-state radiation detectors measuring 10 x 10 x 2 mm^3. Sputtered platinum and gold contacts were applied to polished detector blanks. Voltage versus current characteristics were determined for the devices at 25 C. Pulse height spectra were obtained using ^{241}Am and ^{109}Cd at both 25 C and 150 C with applied bias of 9,000 V/cm. Current versus temperature was measured over the temperature range of 30 C to 150 C. Performance was measured at energies of 22.1 and 59.5 keV over a temperature range of −70 C to 170 C. Current versus dose rate was measured with 662 keV gamma irradiation. A value of the Mobility-Lifetime product ($\mu\tau$) for electrons was estimated. Time and temperature dependence of photo-peak position using Pulse Height Analysis (PHA) was studied.

6434 (CIEMAT–733) **Statistics of multi-tube detecting systems.** Grau Carles, P.; Grau Malonda, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 19p. (In Spanish). Order Number DE95721642. Source: OSTI; NTIS; INIS.

In this paper three new statistical theorems are demonstrated and applied. These theorems simplify very much the obtention of the formulae to compute the counting efficiency when the detection system is formed by several photomultipliers associated in coincidence and sume. These theorems are applied to several photomultiplier arrangements in order to show their potential and the application.

6435 (CIEMAT–742) **Probabilities and energies to obtain the counting efficiency of electron-capture nuclides, KLMN model.** Casas Galiano, G.; Grau Malonda, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 30p. (In Spanish). Order Number DE95722436. Source: OSTI; NTIS; INIS.

An intelligent computer program has been developed to obtain the mathematical formulae to compute the probabilities and reduced energies of the different atomic rearrangement pathways following electron-capture decay. Creation and annihilation operators for Auger and X processes have been introduced. Taking into account the symmetries associated with each process, 262 different pathways were obtained. This model allows us to obtain the influence of the M-electron-capture in the counting efficiency when the atomic number of the nuclide is high.

6436 (CIEMAT–743) **Liquid scintillation counting standardization of "125 I in organic and inorganic samples by the CIEMAT/NIST method.** Rodriguez Barquera, L.; Grau Malonda, A.; Los Arcos Merino, J.M.; Grau Carles, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 30p. (In Spanish). Order Number DE95722437. Source: OSTI; NTIS; INIS.

The liquid scintillation counting standardization of organic and inorganic samples of "125 I by the CIEMAT/NIST method using five different scintillators is described. The discrepancies between experimental and computed efficiencies are lower than 1.4% and 1.7%, for inorganic and organic samples, respectively, in the interval 421-226 of quenching parameter. Both organic and inorganic solutions have been standardized in terms of activity concentration to an overall uncertainty of 0.76%.

6437 (CIEMAT–753) **Preparation and LSC standardization of "89 Sr (DNP) using the CIEMAT/NIST method.** Rodriguez Barquero, L.; Arcos Merino, J.M. Los; Grau Malonda, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 22p. (In Spanish). Order Number DE95730388. Source: OSTI; NTIS; INIS.

A procedure for preparation of liquid scintillation counting samples of the strontium DNP complex, labelled with "89 Sr, is described. The chemical quench, the counting stability and spectral evolution of this compound is studied in six scintillators, Toluene, Toluene-alcohol, Dioxane-naphthalene, HiSafe II, Ultima-Gold and Instagel. The liquid scintillation standardization of "89Sr-DNP by the CIEMAT/NIST method, using Hisafe II and Ultima-Gold scintillators, has been carried out. The discrepancies between experimental and computed efficiencies are lower than 0.38% and 0.48%, respectively. The solution has been standardized in terms of activity concentration to an overall uncertainty of 0.38%. (Author)

6438 (CRN–94-09) **Detectors with gaseous micro strips (MSGC): realisation and tests.** Mack, V.; Barthe, S.; Bergdolt, A.M.; Blaes, R.; Brom, J.M.; Cailleret, J.; Christophel, E.; Coffin, J.; Eberle, H.; Fang, R.; Fontaine, J.C.; Geist, W.; Kachelhoffer, T.; Kettunen, H.; Michalon, A.; Pallares, A.; Romero, A.; Riester, J.L.; Schunck, J.P.;.Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1994. 26p. (In French). Order Number DE95611193. Source: OSTI; NTIS (US Sales Only); INIS.

The idea of detectors with gaseous micro strips (MSGC) began in the year 1988. Their development seems to be very important for the future of experiments in high energy physics. The basic principle is the same that this one of threads chambers. In comparison with classical chambers the spatial resolution is broadly improved. 5 refs., 21 figs.

6439 (DESY–94-130) **Beam tests of prototype fiber detectors for the H1 forward proton spectrometer.** Baehr, J.; Hiller, K.; Hoffmann, B.; Luedecke, H.; Menchikov, A.; Nahnhauer, R.; Roloff, H.E.; Tonisch, F.; Voelkert, R. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Jul 1994. 24p. Order Number DE95725961. Source: OSTI; NTIS (US Sales Only); INIS.

Different prototypes of fiber detectors with an internal trigger system were tested in a 5 GeV electron beam at DESY. A silicon microstrip telescope was used for an external reference measurement of the beam to study the spatial resolution of the fiber detectors. On average 75% of all crossing electron tracks could be reconstructed with a precision better than 150 μm. These successful methodical investigations led to the installation of similar detectors in the proton beamline 81 m downstream of the central H1-detector at HERA as part of a forward proton spectrometer in spring 1994. (orig.)

6440 (FNAL/C–94/312) **Performance of a large scale scintillating fiber tracker using VLPC readout.** D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–64: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003746. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report on results of a cosmic-ray test of a 3,072 channel scintillating fiber tracker using VLPC readout. This system is a prototype for the D0 detector tracking upgrade, and represents a configuration that is similar to that planned for the final detector. A detailed description of the cosmic ray test, including trigger, fiber configuration, lightguides, VLPC cassettes and cryogenics, calibration system, and DAQ is given. Tracking results with a muon momentum cutoff of 2.5 GeV/c include R-ϕ and R-Z resolution studies, light yield/mip, and efficiency measurements. Preliminary analysis gives a most probable value of 19.2 photoelectrons/mip per fiber doublet, an R-ϕ resolution of 163 microns (before corrections for fiber position survey), and an efficiency of nearly 100% after accounting for known dead channels in the system.

6441 (FNAL/C–94/318-E) **VLPC characterization for the Dzero upgrade.** D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–62: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003742. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have studied the performance characteristics of approximately 4,000 Visible Light Photon Counters (VLPC) over a range of operating temperatures and biases. They will describe the characterization procedure and present the measured gain, noise, and relative quantum efficiency for the devices. They will also discuss the general operation of the devices and the significant problems encountered during the characterization.

6442 (FNAL/C–94/335-E) **The D0 Silicon Tracker: A completely redesigned vertex detector.** Heinson, A.P. (California Univ., Riverside, CA (United States). Dept. of Physics). The D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–56: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003500. Source: OSTI; NTIS; INIS; GPO Dep.

Over the last year and a half, the D0 collaboration has undertaken a complete redesign of the Silicon Tracker for its upgrade. The new design optimizes geometrical acceptance and tracking efficiency for $|\eta| \leq 2$, in order to maximize the high transverse momentum physics accessible to D0 such as the top quark search. Details of the new design and reasons for the changes are presented here.

6443 (FNAL/C–94/352-E) **Operation and performance of the silicon vertex detector (SVX') at CDF.** Singh, P.P. (Univ. of Pittsburgh, PA (United States). Dept. of Physics and Astronomy). Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–60: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003380. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe the operation and performance of the Silicon Vertex Detector (SVX'), which replaced the CDF SVX detector for run Ib of the Fermilab Tevatron Collider. The new features of the SVX' include AC coupled readout, Field OXide Field Effect Transistor (FOXFET) biasing and radiation hard front end electronics. The authors expect the detector to survive beyond the 100 pb^{-1} of data taking anticipated for the present CDF physics run. Preliminary results from the collider data show that the detector has a resolution of about 12 μm. This provides a powerful tool to do top and bottom physics.

6444 (FNAL/C–94/370) **Dv upgrade muon electronics design.** Baldin, B.; Green, D.; Haggerty, H.; Hansen, S. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941061–9: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95003744. Source: OSTI; NTIS; INIS; GPO Dep.

The planned luminosity for the upgrade is ten times higher than at present ($L \sim 10^{32} cm^{-2} s^{-1}$) and involves a time between collisions as small as 132 ns. To operate in this environment, completely new electronics is required for the 17,500 proportional drift tubes of the system. These electronics include a deadtimeless readout, a digital TDC with about 1 ns binning for the wire signals, fast charge integrators and pipelined ADCs for digitizing the pad electrode signals, a new wire signal triggering scheme and its associated trigger logic, and high level DSP processing. Some test results of measurements performed on prototype channels and a comparison with the existing electronics are presented.

6445 (FNAL/C–94/372) **A high speed digitizing photomultiplier tube base for the KTeV CsI calorimeter.** Whitmore, J. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9409268–1: 5. international conference on calorimetry in high energy physics, Upton, NY (United States), 25 Sep - 1 oct 1994). Order Number DE95003739. Source: OSTI; NTIS; INIS; GPO Dep.

A circuit has been designed to digitize PMT signals over an 18-bit dynamic range with 8-bits of resolution. The crucial element of the circuit is the custom charge integrating and encoding (QIE) ASIC. This chip is designed to operate at rates up to 53 MHz, and, in conjunction with an 8-bit FADC, generates 12-bit floating point output. Bench tests of a 17-bit version of the digital base demonstrated excellent noise performance, linearity and pedestal and gain stability. Twenty-five channels of digitizing PMT bases have been built and used for readout of a CsI array in a test beam at CERN. Performance of these devices in a beam environment is discussed.

6446 (FNAL/C–94/375-E) **Double-sided silicon microstrip sensors for the CDF SVX II detector.** Seidel, S. (Fermi National Accelerator Lab., Batavia, IL (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–66: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004235. Source: OSTI; NTIS; INIS; GPO Dep.

The SVX II is the planned third-generation silicon vertex detector in the Collider Detector at Fermilab. Now in the prototyping phase, it is scheduled for operation in Tevatron Run II. This document describes aspects of the detector related to the design of the silicon microstrip sensors.

6447 (FNAL/C–94/377-E) **The CDF silicon vertex detector SVX and its upgrades.** Seidel, S. (Fermi National Accelerator Lab., Batavia, IL (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9306398–1: 2. workshop on vertex detectors, Lake Bohinji (Slovenia), 12-17 Jun 1993). Order Number DE95003743. Source: OSTI; NTIS; INIS; GPO Dep.

The three generations of CDF silicon vertex detectors, SVX, SVX′, and SVX II, are described. SVX, which operated during Tevatron run Ia, achieved 10.6 μm resolution in $r - \phi$. SVX′ is a radiation-hard device for run Ib with a similar but improved mechanical design and improved signal/noise. SVX II, which will be installed for run II, will track in three dimensions with radiation tolerance and electronics appropriate to a Main Injector environment.

6448 (FNAL/C–94/398) **The KTeV PMT laser monitoring system.** Nguyen, H.H. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9409268–2: 5. international conference on calorimetry in high energy physics, Upton, NY (United States), 25 Sep - 1 oct 1994). Order Number DE95004237. Source: OSTI; NTIS; INIS; GPO Dep.

The KTeV (Kaons at the TeVatron) collaboration is currently building a high-precision, pure CsI electromagnetic calorimeter with sophisticated digital readout. The KTeV CsI electromagnetic calorimeter will be monitored in situ by a light pulser system. Pulsed light from a liquid dye scintillator, itself pumped by a Nd:YAG laser, will be injected into each PMT of the calorimeter. The system is designed to linearize the response of the combined PMT and readout electronics, as well as monitor the gains of the PMT's.

6449 (FNAL-TM–1906) **Standardization of CDF and Dv reported luminosities.** Bantly, J.; Plunkett, R.; Pruss, S.; Tartaglia, M. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95003388. Source: OSTI; NTIS; INIS; GPO Dep.

During FNAL collider store 5094, CDF- and Dv modified the computation of their reported luminosities to utilize a standardized world average inelastic cross-section. The changes made at each experiment and in the Accelerator Division are detailed below. A net decrease was expected and was observed for the reported instantaneous luminosity from each experiment. These changes affect the estimates of instantaneous and integrated luminosities reported to the Accelerator Division for the purposes of operational coordination.

6450 (FNAL-TM–1913) **Operation and tests of a DDC101 A/D.** Nguyen, H. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95003747. Source: OSTI; NTIS; INIS; GPO Dep.

For the KTeV PMT laser monitoring system, one needs a high resolution device with a large dynamic range to be used for digitizing PIN photodiodes. The dynamic range should be wider than or comparable to the KTeV digitizer (17-bits). The Burr-Brown DDC101 is a precision, wide dynamic range, charge digitizing A/D converter with 20-bit resolution, packaged in a 28-pin plastic, double-wide DP. Low level current output devices, such as photosensors can be directly connected to its input. The digital output

can be clocked-out serially from the pins. For typical operations, a relatively wide gate of 1 msec should be used. The full scale charge is 500 pC for unipolar mode. The bipolar mode scale is ± 250 pC. The advertised integral nonlinearity is 0.003% of FSR. This document describes only the basic DDC101 operations since full detail can be found in the DDC101 manual. Tests results are given in section 3.

6451 (LA–12833-MS) **Calculations of the neutron response of boron-loaded scintillators.** Byrd, R.C.; Urban, W.T. Los Alamos National Lab., NM (United States). Dec 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95003489. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Computer simulations of the neutron response of scintillation detectors have traditionally required specialized computer programs that account for the nonlinear conversion between deposited energy and light output. Such codes, however, do not allow the flexible choices of geometry and materials incorporated in general-purpose programs such as the Monte Carlo N-Particle (MCNP) transport code developed at Los Alamos National Laboratory. The newest version of this program (MCNP4A) provides a convenient option to select particular neutron events for output to a detailed history file. This new option is especially useful for modeling boron-loaded plastic (BC454) scintillators, whose response cannot be described using either the specialized scintillator programs or previous versions of the MCNP code. In particular, such detectors can be used as neutron spectrometers by selecting proton recoil signals from only events where the incident neutron has deposited essentially its entire energy in the detector. Using the new MCNP4A techniques, this report presents a detailed study of the capabilities of BC454 scintillators for neutron spectroscopy. New calculations are compared with those from previous studies of conventional and boron-loaded scintillators, and complete parameterizations are developed to describe the energy-to-light conversion, detection efficiency, and angular sensitivity of BC454-based detectors. These relations are then inverted to provide measurements of energy spectra for incident neutrons from arbitrary incident directions, leading to predictions of energy spectra that obtain resolutions of 25-40% without any unfolding. Using techniques for neutron-by-neutron energy measurements also allows comparisons with previous measurements made using prototype detectors. The success of these comparisons provides the basis for developing a portable version of the instrument, the Field Neutron Spectrometer.

6452 (LA-SUB–94-95) **Fluorescent materials consultation. Final report, 15 August 1987–30 September 1989.** Locker, D. Los Alamos National Lab., NM (United States); RDA Logicon, Albuquerque, NM (United States). [1989]. 3p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE94015400. Source: OSTI; NTIS; GPO Dep.

Paper briefly describes the technical assistance that R&D Associates of Albuquerque, NM provided to Los Alamos National Laboratories/CLS in neutral particle beam direction sensing. Subcontractor assisted in making CLS e-beam machine functional, concluded that high-aspect detector element formats would be highly beneficial for a Wire and Fluorescent Fiber Offset Grid (WAFFOG) device, and designed a method used to coat ribbons and wires with fluor for a subscale WAFFOG. Work done during the course of this subcontract resulted in innovations which could extend the usefulness of the WAFFOG concept and furthered understanding of the WAFFOG boresighting problem. Later technical extensions include registered neutral particle beam scoring and methods for emulating or impressing acquisition, tracking, and pointing into a neutral particle beam facility function.

6453 (LBL–34831, pp. 341-352) **The PHENIX experiment at RHIC.** Tonse, S.R. (Lawrence Livermore National Lab., CA (United States)); Thomas, J.H. Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Later this decade the Relativistic Heavy Ion Collider (RHIC) will be built at Brookhaven Natl. Lab. Its goals will be to accelerate and collide Au beams at 100 GeV/c in an attempt to create a Quark Gluon Plasma (QGP). The PHENIX detector aims to detect the QGP through its leptonic and hadronic signatures. The authors describe here its physics capabilities and the details of the apparatus designed to pick out rare leptonic signatures from among hadronic multiplicities of up to 1500 particles per unit of rapidity.

6454 (LBL–34831, pp. 353-361) **The STAR experiment at RHIC.** Harris, J.W. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract AC03-76SF00098. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

An overview of the Solenoidal Tracker at RHIC (STAR) experiment and the anticipated physics program is presented. The STAR experiment will concentrate on hadronic observables over a large solid angle at the Relativistic Heavy Ion Collider in order to measure event-by-event characteristics of the collisions. STAR will search for signatures of the Quark-Gluon Plasma and investigate the behaviour of strongly-interacting matter at high energy density.

6455 (MPI-PhE–94-13) **Low-energy X-ray detection in cryogenic detectors with tungsten thermometers.** Colling, P.; Nucciotti, A.; Bucci, C.; Cooper, S.; Ferger, P.; Frank, M.; Nagel, U.; Proebst, F.; Seidel, W. Max-Planck-Institut fuer Physik, Muenchen (Germany). Werner-Heisenberg-Institut. Aug 1994. 20p. Order Number DE95725943. Source: OSTI; NTIS (US Sales Only); INIS.

In the course of our development of calorimetric particle detectors with superconducting phase transition thermometers, we have succeeded in depositing epitaxial α-tungsten films on sapphire which have critical temperatures T_c near 15 mK. To our knowledge this is the first time that the T_c of bulk tungsten has been observed in thin films. Such films used as thermometers are very sensitive and provide good energy resolution: with 4 g and 32 g sapphire crystals energy resolutions of better than 100eV (FWHM) for 1.5 KeV X-rays have been achieved. (orig.)

6456 (MPI-PhE–94-14) **Model for cryogenic particle detectors with superconducting phase transition thermometers.** Proebst, F.; Frank, M.; Cooper, S.; Colling, P.; Dummer, D.; Ferger, P.; Nucciotti, A.; Seidel, W.; Stodolsky, L. No corporate text available. Sep 1994. 32p. Order Number DE95731743. Source: OSTI; NTIS (US Sales Only); INIS.

We present data on a detector composed of an 18 g Si crystal and a superconducting phase transition thermometer which could be operated over a wide temperature range. An energy resolution of 1 keV (FWHM) has been obtained for 60 keV photons. The signals consist of two components: A fast one and a slow one, with decay times of 1.5 ms and 30-60 ms, respectively. In this paper we present a simple model which takes thermal and non-thermal phonon processes into account and provides a description of the observed temperature dependence of the pulse shape. The fast component, which completely dominates the signal at low temperatures, is due to high-frequency non-thermal phonons being absorbed in the thermometer. Thermalization of these phonons then leads to a temperature rise of the absorber, which causes the slow thermal component. At the highest operating temperatures ($T \approx 80$ mK) the amplitude of the slow component is roughly as expected from the heat capacity of the absorber. The strong suppression of the slow component at low temperatures is explained mostly as a consequence of the weak thermal coupling between electrons and phonons in the thermometer at low temperatures. (orig.)

6457 (UCRL-JC–116456) **Characteristics of an ultrafast x-ray streak camera.** Shepherd, R. (and others); Booth, R.; Price, D. Lawrence Livermore National Lab., CA (United States). Jun 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940723–32: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 24-29 Jul 1994). Order Number DE95004210. Source: OSTI; NTIS; GPO Dep.

The detection and temporal dispersion of the x-rays using x-ray streak cameras has been limited to a resolution of 2 ps, primarily

due to the transit time dispersion of the electrons between the photocathode and the acceleration grid. The transit time spread of the electrons traveling from the photocathode to the acceleration grid is inversely proportional to the accelerating field. By increasing the field by a factor of 7, we have minimized the effects of transit time dispersion in the photocathode/accelerating grid region and produce an x-ray streak camera with sub-picosecond temporal resolution (~900 fs). The streak camera has been calibrated using a Michelson interferometer and 100 fs, 400 nm laser light. Time resolved x-ray data is shown from an aluminum target heated at 10^{18} W/cm^2 with a 100 fs, 400 nm laser.

6458 (CONF-9405258–, pp. 17-19) **Survey of pile penetration with velocity logging.** Inoue, S. (Taisei Kisosekkei Co. Ltd., Tokyo (Japan)); Kurimoto, H. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

Acoustic velocity was logged to survey the penetration state of existing bridge foundation pile which remained underground. The result of logging was reported. Boring was made behind the bridge abutment to grasp the ground structure and underwater level, and log the acoustic velocity in the vicinity of existing bridge. For the acoustic velocity logging, measurement was continuously made, by downhole method, with a horizontal component array geophone, amplifier and recorder. Vibration was generated by hammering at the top of abutment. The location of pile end was presumed from the refraction point of travel-time curve due to the difference in seismic wave velocity between the inside of pile and underground soil. As a result of measurement, difference in slope of travel-time curve was generated at the depth of about 9 to 10m. The slope was 2500 and 1200m/s in the shallower range and deeper range, respectively. The former velocity and latter velocity were judged to be mainly in the inside of existing concrete pile and underground stratum, respectively. The pile end depth was presumed to be 10m within an error of 0.5m. Data are dispersed in the shallower part, so that the pile penetration is estimated with difficulty. 1 ref., 4 figs.

6459 (CONF-9405258–, pp. 20-21) **Conversion from radioactive counts to density.** Matsuyama, M. (Daiwa Exploration and Consulting Company, Tokyo (Japan)). Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The present paper explained how to convert the observed radiant quantity into the density for the density logging. According to the principle of Compton scattering, the scattering intensity of radiant rays to the irradiated object is a function of radiation source intensity, object density and environmental factor. The environmental factor is a parameter which characteristically reflects the pore diameter, mud water, casing and measuring instrument. It can be determined, by least square, from relational formulae through measurement at two or more points with a density presumed to be known. Practically, sample is collected from the borehole. The weight is obtained per unit volume. Then by combing it with the observed values, the radiation source intensity and environmental factor are determined. As a density conversion method for the density logging, there is a method in which the radiation source intensity and environmental factor are fixed in advance with artificial samples of which the density is already known. However, that method is not always simple because measurement must have been made under many combined conditions. Though it is necessary for the present method to measure the weight per unit volume, it is judged not to be a so heavy burden.

6460 (CONF-9405258–, pp. 22-26) **Comparison between VSP travel times and sonic integrated times. 2nd Report.** Tezuka, K. (Japan Petroleum Exploration Co. Ltd., Tokyo (Japan)); Miyairi, M.; Matsuoka, T.; Takahashi, A.; Arakawa, Y. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

Study with borehole data was made to investigate the cause of discrepancy between the seismic exploration record and synthetic seismic record. As a cause of discrepancy between the VSP travel time and sonic integrated time, investigated were the dispersion of seismic wave, refraction of VSP wave in the dip stratum, physical change in the vicinity of borehole. As a result, why that discrepancy tends to be large in the mud, sand and other depositional strata was known to be explainable by the dispersion of seismic wave. The influence to be brought by the dip of stratum was judged to be not considerably large, because high-angle dip stratum was not given in the borehole data for the present study. Though the study was intended to investigate the influence of velocity lowered by the change in physical properties in the vicinity of borehole, possibility of measuring the velocity in the alteration zone was suggested because the exploration depth of acoustic wave logging was not sufficient in the igneous rock stratum. As compared with the conventional synthetic seismic record, the presently prepared one based on the dispersion theory for the borehole which showed a monotonous increase in travel time differential gave a result which agreed well to the actual section of VSP reflection, so that it was proved effective to take the dispersion into consideration. 5 refs., 8 figs.

6461 (CONF-9405258–, pp. 27-30) **Field experiment of 3D reverse VSP.** Takahashi, T. (OYO Corp., Tokyo (Japan)); Ando, N. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

Exploration experiment was made to confirm whether the reverse VSP method in which the vibration is generated in the borehole and received on the ground surface is effective or not. Downward from the ground surface in the site, there extends homogeneous Tertiary Period's mudstone, in which thin tuff's parting layers and crush zone are distributed as a low-angle dip stratum with a thickness of 10cm to 1m. The experiment aimed at knowing the distribution of such thin strata and their dip in order to investigate the resolving power of strata and ability of three-dimensional exploration by the present method. The boreholes were 50m in length and positioned radially with observation points which were 5m in offset distance and 20m or less in interval on the ground surface. In the borehole, the vibration was generated by a small quantity of dynamite exploded every 1m from the depth of 50m up to the ground surface. As a result, the reflected high frequency P-wave which was 300Hz in frequency could be observed so that thin strata which were 1m or less in thickness were clearly detected. The strike and dip were obtained which agreed in value with those presumed through a geological survey by three-dimensional migration image. 1 ref., 8 figs.

6462 (CONF-9405258–, pp. 41-45) **Cross-polarization borehole radar system with a RF analog optical transmission link.** Miwa, T. (Tohoku University, Sendai (Japan). Faculty of

Engineering); Sato, M.; Niitsuma, H. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The cross-polarization borehole radar system (BRS) was reported. The RF analogue optical transmission system (using the optical fiber cable) was introduced into the signal transmission between the sonde and the surface station to broaden the band and to heighten the S/N ratio. The sonde consisted of cable head (to transmit the trigger signal), receiving antenna, and transmitting antenna. The transmitting antenna was excited by the trigger signal from the surface to generate the pulse by the pulse generator. The signal received by the receiving antenna was sent to the oscilloscope on the surface. The field test of cross-polarization borehole system revealed that the effect of noise associated with the BRS employing the eccentric cable did not appear on the BRS. Examples of field test of the cross-polarization borehole measurement system employing the BRS were described. 4 refs., 8 figs., 1 tab.

6463 (CRIE-R–93009) **Application of optical fiber amplifier for wavelength division multiplexing communication system. Part 2. Design of four-channel transmission system using two EDFA repeaters.** Isawa, K.; Kurono, M.; Kuribara, M. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 34p. (In Japanese). Order Number DE95730179. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

Circuit design was made in case of applying an Er^{3+}-doped fiber amplifier (EDFA) to the conventional one-wavelength optical communication system and four-wavelength division multiplexing optical communication system with two in-line amplifiers. Circuit-designed to use two EDFA's for amplifying an optical signal with a wavelength of 1540nm, the one-wavelength optical communication system experimentally demonstrated that the circuit could be formed to the maximum length of 180km. In the remote pumping through the signal transmission line used as a pumped optical supply line, the electric source is not necessary at the amplification point, so that the EDFA can be utilized under a good condition, if the pumped optical output is sufficiently high. The wavelength to pump the EDFA is 0.98μm and 1.48μm. Circuit-designed to multiplex wavelengths around 1555nm, the four-wavelength division multiplexing optical communication system with two in-line amplifiers gives the smallest difference in output among wavelengths on condition that the wavelength is set to equalize the amplified wavelength output at both transmission and reception points at the required input level. Mutual relation was elucidated among the in-line input level, working wavelength band and transmission distance. 8 refs., 41 figs.

6464 (CONF-9405258–, pp. 175-178) **Development and application of an acoustic profiling system for detection of wedge-like saline layer.** Nishimura, K. (Geological Survey of Japan, Tsukuba (Japan)); Inouchi, Y.; Ishihara, T.; Tokuoka, T.; Anma, K.; Tsuchiya, Y.; Ishihara, T. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The present paper reports a system developed to be used for detecting the wedge-like saline layer. The survey instrument of that system is functionally to transmit the acoustic wave (200kHz in frequency) from an electric strain type wave transmitter/receiver, and amplify, detect and record the received signal of that wave which is sent back at 200kHz kept intact without conversion in frequency. With that survey instrument, connected is a digital geologger which is developed to collect and record, with fidelity, the very weak reflected waveform, and composed of A/D converter and EXABYTE tape driver. An example of having recorded the following is exhibited as a result of survey conducted with the present system in Lake Nakanoumi, Shimane Prefecture: there exist several horizontal reflection surfaces proving the existence of layers of discontinuity about 4 to 5m below the level of lake surface. If the lake water is depthwise demarcated about 5m below it, the shallower water is fresh water containing a large quantity of dispersed matter which is judged to be floating matter, while the deeper water is acoustically limpid sea water almost without floating matter and has layered structure grasped. 3 refs., 6 figs., 1 tab.

6465 (CONF-9405258–, pp. 479-481) **On measuring settlement at each sea bed layer by magnetic measurement system.** Kusumi, H. (Kansai University, Osaka (Japan). Faculty of Engineering); Nishida, K.; Okuno, J.; Nishimura, S. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The present paper explains how to measure, by magnetic measurement system, the seabed settlement layer by layer. Sequentially, the measurement is to drill a borehole at the measurement spot, insert a hole-retaining pipe to prevent the hole wall from tumbling down, pile the hole wall with settlement elements (permanent magnets), perpendicularly lower a probe (equipped with two magnetic sensors) and measure the change in unbalanced current generated in the magnetic sensor by the probe's passing the settlement elements, which can be therefore located with accuracy by mm. By the present system, measurement was made for about seven years with about 120m deep observation holes drilled in the soil-improved and unimproved grounds of Rokko Island, Kobe City. As a result of that measurement, the following is reported: the compression of multi-layer ground could be quantitatively grasped layer by layer in detail. Most of the compaction/settlement phenomena are generated in the alluvial clay layers. The effect of soil improvement was confirmed in the ground. 1 ref., 9 figs.

6466 (WHC-SD-EN-AP–181) **Instructions for borehole sampling.** Reynolds, K.D.; Lindsey, K.A. Westinghouse Hanford Co., Richland, WA (United States). 11 Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95003857. Source: OSTI; NTIS; INIS; GPO Dep.

Geologic systems generally are complex with physical properties and trends that can be difficult to predict. Subsurface geology exerts a fundamental control on groundwater flow and contaminant transport. The primary source for direct observation of subsurface geologic information is a borehole. However, direct observations from a borehole essentially are limited to the diameter and spacing of boreholes and the quality of the information derived from the drilling. Because it is impractical to drill a borehole every few feet to obtain data, it is necessary to maximize the data gathered during limited drilling operations. A technically defensible balance between the customer's data quality objectives and control of drilling costs through limited drilling can be achieved with proper conduct of operations. This report presents the minimum criteria for geologic and hydrologic characterization and sampling that must be met during drilling. It outlines the sampling goals that need to be addressed when drilling boreholes, and the types of drilling techniques that work best to achieve these goals under the geologic conditions found at Hanford. This report provides general guidelines for: (1) how sampling methods are controlled by data needs, (2) how minimum sampling requirements change as knowledge and needs change, and (3) when drilling and sampling parameters need to be closely controlled with respect to the specific data needs. Consequently, the report is divided into two sections that

center on: (1) a discussion of basic categories of subsurface characterization, sampling, and sampling techniques, and (2) guidelines for determining which drilling and sampling techniques meet required characterization and sampling objectives.

In this paper, an attempt will be made to give an overview of the scientific contents of the meeting. Since it would be impossible to cover exhaustively all the topics presented, we have tried to emphasize some applications, with special emphasis to the analytical aspects of the presentation. The Sixth International Symposium on Resonance Ionization Spectroscopy and its Applications (RIS-92) was held in Santa Fe, New Mexico, USA, from May 24 to 29, 1992.

6468 (KCP–613-4805) **Calorimetric measurement of energy of ultrasonic cleaners.** Harding, W.B. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95003938. Source: OSTI; NTIS; GPO Dep.

The development of a calorimeter that measured the power within an ultrasonic cleaning tank is presented. The principle involved is explained. Several types of calorimeter that were tested are described. Measurement of the power in an ultrasonic cleaner permits: (1) comparing different ultrasonic cleaners; (2) monitoring the performance of a specific cleaner; (3) measuring the distribution of power in a cleaning tank, and (4) evaluating the effects of process variables on the power.

6469 (SAND–95-8200) **Dynamic response of a transducer mounted at one end of an acoustical cavity which is subjected to a specified pressure at the open end of the cavity.** Benedetti, G.A.; Benson, J.Z. Sandia National Labs., Livermore, CA (United States). Nov 1994. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004192. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to develop a mathematical model for a pressure transducer mounted in a fluid filled cavity (a system) and examine the pressure "measurement" error of the cavity and transducer by computing the dynamic response (output pressure) of the system to a specified pressure time history (input pressure). The "measurement" error is determined by comparing the calculated output pressure to the specified input pressure. The dynamic response of a transducer mounted at one end of a one-dimensional acoustical cavity is determined. The cavity is filled with a compressible isentropic fluid, and the fluid at the open end of the cavity (i.e., the boundary at $x = 0$) is subjected to a specified uniform axial input pressure. At the other end of the cavity the transducer is represented as a mass, spring, and damper system. Consequently, the boundary condition at $x = \ell$ is also time dependent. The general solution to the boundary value problem, as well as the steady state solution for periodic excitation, is obtained by integrating a coupled set of ordinary differential equations.

6470 (UCRL-JC–116021) **Nanostethoscopy: A new mode of operation of the atomic force microscope.** Keaton, A.; Holzrichter, J.F.; Balhorn, R.; Siekaus, W.J. Lawrence Livermore National Lab., CA (United States). Feb 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9403184–1: NATO Advanced Study Institute conference, Schluchsee (Germany), 7-18 Mar 1994). Order Number DE95003646. Source: OSTI; NTIS; GPO Dep.

The authors introduce a new mode of operation of the atomic force microscope (AFM). This detection scheme, a "Nano-Stethoscope". Involves using the atomic force microscope in a novel acoustic mode not generally recognized. The Nano-Stethoscope uses the conventional scanning feature to locate a desired site, positions the AFM microscope tip over the site, holds the cantilever stationary (in x and v) and records the tip's z-motion as a function of time. The tip/cantilever system thus functions as a micro-motion detector to respond to characteristic "pulsations", nano-configurational chances, or any other event that influences the position of the tip as a function of time. The authors have demonstrated the feasibility of using the tip of an AFM in this manner in a biological system with a measurement of the vibrations of an emerging shrimp egg nauplius (~3 μm. -10 Hz) and on the Angstrom scale in a non-biological system i.e. the thermal expansion of metal interconnect lines on a microelectronic circuit.

6471 (UCRL-JC–118476) **NTS-spill test facility wind tunnel exhaust plume characterization.** Kerr, R.; Goldwire, H.; Smith, D.; Rawlings, J.; Schaffer, T.; Robson, J. Los Alamos National Lab., NM (United States). Jul 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–14: 1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95003630. Source: OSTI; NTIS; GPO Dep.

The exhaust plume of the NTS-STF wind tunnel has been characterized to demonstrate its suitability as a target for CALIOPE experiments. Smoke from grenades has been released in multiple quantities and at different positions inside the tunnel. The smoke plumes have been recorded on video tape. The wind velocity profile has also been determined with a moveable array of miniature vane anemometers. These measurements will be used to determine the vapor concentration pathlength as part of the ground truth.

6472 (K/DSRD–116) **Phase I verification and validation of SIMNET-T.** Hartley, D.S. III; Quillinan, J.D.; Kruse, K.L. Oak Ridge National Lab., TN (United States). May 1990. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE95004574. Source: OSTI; NTIS (US Sales Only); GPO Dep.

SIMNET is a prototype system of tank and armored vehicle simulators connected by an electronic network. The prototype is being constructed by Bolt, Beranek, and Newman, Inc. (BBN) and Perceptronics for the Defense Advanced Research Projects Agency (DARPA), with the cooperation of the Army at Fort Knox. Training and Doctrine Command (TRADOC) Analysis Command (TRAC) was tasked with the verification and validation (V&V) of SIMNET. The V&V reported here was performed for TRAC. The verification and validation of a portion of the SIMNET-T system reported here yields certain benefits. The V&V process itself has assisted the system designer in making changes to the model. Also, knowledge of the direction and magnitude of the error terms in the SIMNET approximations provides a basis for evaluating impacts on the training and development missions. More importantly, the SIMNET V&V will provide the basis for making the follow-on CCTT system better. Finally, the SIMNET V&V may be setting a standard for the Army's Verification and Validation program. The verification and validation of SIMNET reported here is a supplement to the ongoing program of exception reporting that is provided by SIMNET training participants. Although several significant findings are reported here, the number and severity of problems reflect only the prototype status of the project. Each of the problems appears correctable with relatively small effort.

6473 (LA-SUB–94-146-Task-1) **Final report for confinement vessel analysis: Task 1, Correlation of new vessel data with finite element results.** Lewis, B.B. (APTEK, Inc., Colorado Springs, CO (United States)). Los Alamos National Lab., NM (United States); APTEK, Inc., Colorado Springs, CO (United States). 30 Nov 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95001393. Source: OSTI; NTIS; GPO Dep.

Los Alamos performed tests of a modified confinement vessel in November 1992 to gain a better understanding of the response of the confinement vessel. The first test was meant to duplicate, with additional instrumentation, tests done previously for correlation with analysis. Task 1 of Subcontract Number 9-XH3-0607K-1 was the correlation of this new vessel test data with the results of finite element analyses. The authors also examined the data for the other test, which was for optical port development. The tests were numbered H-1573 and H-1562 and were fired on November 9 and 10, 1992, respectively. Test H-1573 was identical to the previous 40 lb tests except that a Burke tube was used to support the explosive charge while the explosive was freely suspended in the earlier tests. The second test, H-1562, was for development of the optical port. In addition to the Burke tube, this test also had additional components on the inside of the ports to protect the windows. The following are conclusions and recommendations drawn from assessment and correlation of tests H-1573 and H-1562: (1) yielding was measured at the bottom of the vessel for these tests; (2) the presence of a support tube in the vessel may have caused focusing of the pressure at the bottom, obscuring the response mechanism thought to have caused yielding in earlier tests; (3) the frequencies predicted using the finite element analysis correlated fairly well with the test results, but the analysis did not predict the yielding measured at the –73 degrees locations; (4) excellent pressure measurements were obtained; (5) better methods of obtaining acceleration data for the windows need to be developed; and (6) the authors believe that the window damage is caused by response of the vessel.

6474 (LA-SUB–94-146-Task-2) **Final report for confinement vessel analysis. Task 2, Safety vessel impact analyses.** Murray, Y.D. (APTEK, Inc., Colorado Springs, CO (United States)). Los Alamos National Lab., NM (United States); APTEK, Inc., Colorado Springs, CO (United States). 26 Jan 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95001394. Source: OSTI; NTIS; GPO Dep.

This report describes two sets of finite element analyses performed under Task 2 of the Confinement Vessel Analysis Program. In each set of analyses, a charge is assumed to have detonated inside the confinement vessel, causing the confinement vessel to fail in either of two ways; locally around the weld line of a nozzle, or catastrophically into two hemispheres. High pressure gases from the internal detonation pressurize the inside of the safety vessel and accelerate the fractured nozzle or hemisphere into the safety vessel. The first set of analyses examines the structural integrity of the safety vessel when impacted by the fractured nozzle. The objective of these calculations is to determine if the high strength bolt heads attached to the nozzle penetrate or fracture the lower strength safety vessel, thus allowing gaseous detonation products to escape to the atmosphere. The two dimensional analyses predict partial penetration of the safety vessel beneath the tip of the penetrator. The analyses also predict maximum principal strains in the safety vessel which exceed the measured ultimate strain of steel. The second set of analyses examines the containment capability of the safety vessel closure when impacted by half a confinement vessel (hemisphere). The predicted response is the formation of a 0.6-inch gap, caused by relative sliding and separation between the two halves of the safety vessel. Additional analyses with closure designs that prevent the gap formation are recommended.

6475 (LA-SUB–94-146-Task-3) **Final report for confinement vessel analysis. Task 3, Analysis of confinement vessel doors.** Lewis, B.B. (APTEK, Inc., Colorado Springs, CO (United States)). Los Alamos National Lab., NM (United States); APTEK, Inc., Colorado Springs, CO (United States). 31 Dec 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95001395. Source: OSTI; NTIS; GPO Dep.

The confinement vessel has five closure doors of two different sizes. The vessel must withstand an initial dynamic load and a quasi-static internal pressure with no leakage of gases through the port seals. Task 3 of the Confinement Vessel Analysis Program was to assess the doors for safety. Of primary concern is the integrity of the seal. This encompasses the structural integrity of the door and nozzle as separate structural elements and the relative motion between the door and nozzle which could cause leakage of gases around the seals. In addition, the authors would like to obtain a better understanding of the effect of the bolt preload, especially as it affects the dynamic response of the structure. The authors explain the objectives of the task in Section 1, describe the models used for the analyses in Section 2, and give results in Section 3. They list conclusions and recommendations in Section 4.

6476 (LA-UR–94-3490) **Explosive performance measurements on large, multiple-hole arrays and large masses of conventional explosive.** McKown, T.O. (Los Alamos National Lab., NM (United States)); Eilers, D.D.; Williams, P.E. Los Alamos National Lab., NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950247–1: 21. annual conference on explosives and blasting techniques and 11th annual symposium on explosives and blasting research, Nashville, TN (United States), 5-9 Feb 1995). Order Number DE95002718. Source: OSTI; NTIS; GPO Dep.

The COntinuous Reflectometry for Radius vs. Time EXperiment (CORRTEX) system was developed by the Los Alamos National Laboratory for determining the energy released in a nuclear explosion by measuring the position of its shock front as a function of time. The CORRTEX system, fielding techniques, and the methods and software for data reduction and analysis were developed over a 15 year period with hundreds of measurements made on nuclear tests and high explosive experiments. CORRTEX is a compact, portable, fast-sampling, microprocessor-controlled system, based on time domain reflectometry, requiring only a 24 volt power source and a sensing element. Only the sensing element (a length of 50 ohm coaxial cable) is expended during the detonation. In 1979, the CORRTEX system was shown to be ideally suited for chemical explosive performance measurements. Its utility for diagnosing chemical explosives was further demonstrated with successful measurements on large multiple-hole chemical shots in rock quarries and strip mines. Accurate timing of the detonation of sequenced or ripple fired arrays, as well as data characterizing the initiation, explosive performance and detonation anomalies are obtained. This information can serve as the basis for empirical or modeled improvements to blasting operations. A summary of the special CORRTEX features and well developed analysis techniques together with the experiment designs, data, and conclusions regarding the measurements and explosive performance from several array detonations and the Chemical Kiloton Experiment, 2.9 million pounds of an ammonium nitrate-fuel oil (ANFO) and emulsion blend conducted on the Nevada Test Site in 1993, are presented.

6477 (LA-UR–94-3977) **Techniques for classifying acoustic resonant spectra.** Roberts, R.S.; Lewis, P.S.; Chen, J.T.; Vela, O.A. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411159–1: Asilomar/signals, systems and computers, Pacific Grove, CA (United States), 1 Nov 1994). Order Number DE95003672. Source: OSTI; NTIS; GPO Dep.

A second-generation nondestructive evaluation (NDE) system that discriminates between different types of chemical munitions is under development. The NDE system extracts features from the acoustic spectra of known munitions, builds templates from these features, and performs classification by comparing features extracted from an unknown munition to a template library. Improvements over first-generation feature extraction template construction

and classification algorithms are reported. Results are presented on the performance of the system and a large data set collected from surrogate-filled munitions.

6478 (SAND–95-8202) **Supercritical water oxidation of ammonium picrate.** LaJeunesse, C.A.; Mills, B.E.; Brown, B.G. Sandia National Labs., Livermore, CA (United States). Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004194. Source: OSTI; NTIS; GPO Dep.

This study demonstrates the feasibility of using supercritical water oxidation to destroy ammonium picrate. Analyses of reactor effluent composition at various temperatures, residence times, and oxidant concentrations were used to design an improved reactor configuration for achieving destruction with minimum corrosion. The engineering evaluation reactor, a room-sized laboratory scale reactor, was reconfigured to incorporate this design change. Destruction of ammonium picrate with minimized corrosion was demonstrated on this reconfigured reactor. Factors that must be considered in scaling up to pilot plant size are discussed.

6479 (CONF-9309103–Vol.1, pp. 3-9) **Did the nuclear test moratorium of 1958 teach us anything?.** Brownlee, R.R. (Raytheon Services of Nevada, Las Vegas, NV (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

The history of our behavior during and after the nuclear test moratorium could be mined to the benefit of decision makers, planners, and containment staffs. Some of the lessons learned are reviewed. Given the characteristics of bureaucracies, and the power of the concept of institutional survival, lessons of the past are not apt to be applied with much success. Nevertheless, people knowledgeable about containment are vital to the national interest, and must find a way to keep the science alive.

This article describes nuclear explosion containment from a historical and political aspect. The purpose is to discuss the Containment Evaluation Panel and its effectiveness.

6481 (CONF-9309103–Vol.1, pp. 47-83) **My thoughts about containment.** Duff, R.E. (S-Cubed, La Jolla, CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

An admittedly speculative overview of nuclear test containment philosophy and tunnel stemming predictive capability is presented. The main conclusions are that non-homogeneous rock motion produced by an underground explosion produces conditions where the residual stress field should not be expected to form with the magnitude, at the location, or at the time predicted by continuum models. Such non-homogeneous ground motions have been observed post-shot both along pre-existing fault or bedding planes and along planes not mapped pre-shot as unusual. Current pre-shot continuum analyses do not consider the possible impact of non-homogeneous ground motion on stemming plug formation. Recommendations for alternative calculational procedures, such as three-dimensional discrete element analyses based on measured block interface mechanical properties, are presented. It is recommended that, until these new analyses techniques are verified and shown to provide meaningful quantitative predictions, future test designs should continue to be developed primarily from empirical data and other experience.

6482 (CONF-9309103–Vol.1, pp. 85-119) **Site selection and containment evaluation for LLNL nuclear events.** Olsen, C.W. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

During approximately the past decade, the site selection process at LLNL has evolved as the Test Program needs and resources have changed, containment practices have been modified, and the DOE and other regulatory agencies have become more restrictive. Throughout this period the Containment Program and the Field Operations Program at LLNL have managed a cooperative effort to improve site selection. The site selection process actually is three interrelated tasks, namely, selection of a stockpile hole for a specific nuclear test, selection of a drill site for a stockpile hole, and selection of a new drill site for a specific test. Each proposed site is carefully reviewed for known or projected geologic structure and medium properties, nearby holes, containment experience in the region, likelihood of drilling problems, programmatic need for a given depth of hole, and scheduling of Test Program events and resources. By using a data bank, general knowledge of the Nevada Test Site (NTS) geology, and other information sources, as well as background in drilling large diameter holes at the NTS, LLNL has been able to optimize the use of NTS real estate and programmatic resources. The containment evaluation of a site is facilitated by considering the location before the hole is drilled. The authors discuss imposed restraints and criteria and guidelines for site selection and assignment of events to specific holes, along with the factors that influence selection of a Working Point (WP) depth. Since siting and containment evaluation are strongly related, most major factors related to the containment evaluation process are also reviewed.

6483 (CONF-9309103–Vol.1, pp. 121-128) **Experimental determination of containment versus burial depth for explosions in sand.** Schmidt, R.M. (Boeing Defense & Space Group, Seattle, WA (United States)); Voss, M.E. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an experimental method for determining the dispersion of the source material following a buried explosion in sand. Using the established technique of subscale centrifuge modeling, both visual and chemical analysis using elements of the explosive as a tracer results in a dispersion pattern as a function of depth of burst. It is possible to directly measure the percentage of the source material which remains buried and the percentage that settles on the surface close to ground zero. It is not possible, given size constraints of laboratory samples, to measure dispersion of material that becomes airborne and is spread by atmospheric currents. This necessitated choosing depths of burst well past optimum, where crater volume is relatively small, and most of the source material remains below the ground surface.

6484 (CONF-9309103–Vol.1, pp. 129) **Scaling of deeply buried explosions.** Housen, K.R. (Boeing Defense & Space Group, Seattle, WA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

The containment of underground explosions involves many of the same problems encountered in the related problem of explosive cratering. In particular, for both cases, field tests are often

conducted with yields and burial depths vastly different from those of actual interest. Therefore, the question of scaling must be addressed before field results can be usefully applied. A series of experiments were performed to determine the scaling exponent for large yields, i.e., in a regime in which strength and atmospheric pressure effects are absent. To accomplish this, the tests were conducted in cohesionless dry sand under near-vacuum conditions. Both the charge burial depth and the centripetal acceleration (i.e., scaled yield) were varied. These tests provided the first results in a purely gravity dominated regime with a significant variation (a factor of 600) in the explosive yield. Plots of the scaled crater volume, $V/W^{3/n}$ versus the scaled burial depth, $d/W^{1/n}$ showed that the exponent n is 3.7, which is significantly larger than the value of 3.4 deduced from field tests, yet still below the quarter-root value of 4. Subsequent experiments have shown that, when ambient pressure effects are important, the scaling exponent is smaller than its gravity-regime value. In particular, for 1-atm conditions, the exponent should be in the range of 3.4 to 3.5 for yields in the range of typical field tests, i.e., tons to kilotons. These results suggest that n = 3.4 is not appropriate for large yields.

6485 (CONF-9309103–Vol.1, pp. 133-151) **Low-yield event design and performance review.** Peterson, E. (S-Cubed, La Jolla, CA (United States)); Ristvet, B.; Lacomb, J.; Harris-West, B.; Metcalf, R.; Patch, D. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

The low-yield horizontal-line-of-sight (HLOS) effects tests conducted by DNA use a HLOS drift containment system design that is different from that used on previous standard-yield tests. Mechanical pipe closures for a low-yield test include the fast-acting-closure (FAC), gas-seal-auxiliary-closure (GSAC) and tunnel-and-pipe-seal (TAPS) with the closure nearest the working point (i.e. FAC) designed to also serve as a stemming bulkhead. Alternate lengths of rock-matching and super-lean grouts comprise the HLOS drift stemming column. In contrast, previous standard-yield tests used a modified-auxiliary-closure (MAC), GSAC and TAPS. In that design, the closure nearest the working point (i.e. MAC) was not designed, or positioned, to serve as a stemming bulkhead. In addition, the standard-yield stemming column consisted of a single length of rock-matching grout beginning in the region of the working point followed by a length of superlean grout extending to the MAC. Containment of the low-yield events has been outstanding. There has been no accidental release of radioactivity to the atmosphere and no leakage to the tunnel complex, Vessel 3. Operationally insignificant quantities of activity have been detected in the tunnel complex, Vessel 2, on a few events and some minor quantities of cavity gas have, on occasion, seeped into the LOS pipe. All low-yield tests have qualitatively similar containment system designs. However, overall test details are unique with design differences associated with device yield, test objectives, site geology, etc. In total, twenty three design features have been identified. These design features are examined for differences that may correlate with observed seepage to the HLOS pipe and/or Vessel 2 of the tunnel complex.

6486 (CONF-9309103–Vol.1, pp. 153-178) **Initial cavity-growth/pipe-closure phenomena.** Lie, K. (S-Cubed, La Jolla, CA (United States)); Higginbotham, M.; Peterson, E. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

During the initial cavity formation process the ground-motion-induced closure of the reverse cone and line-of-site (LOS) pipe results in the formation of a high density region (e.g. plug) that blocks the flow of cavity gas into the pipe. However, the dynamic closure process generates high energy material with the potential to flow down the LOS pipe and to thereby affect further pipe closure and/or possibly impact mechanical closures. The reverse cone is therefore designed to generate a competent plug while minimizing damaging pipe flow. Analysis of the onset of the closure processes have to date been performed using a Lagrangian code initially and then coupling those results to the Eulerian SOIL code. Results of those calculations are generally in agreement with existing pipe flow measurements to the extent they show both a first and second flow and, in most cases, they are qualitatively consistent with observed changes in flow amplitude associated with design modifications of the reverse cone and LOS pipe. However, the calculations which describe the first few milliseconds of the closure process tend to over-estimate the plasma flow magnitudes and show no evidence of a jetted liquid flow that has at times been suspected of impacting the mechanical closures.

6487 (CONF-9309103–Vol.1, pp. 179-188) **Do analytic models of near source pipe flow compare to measurement?.** Higginbotham, M.L. (S-Cubed, La Jolla, CA (United States)); Sandmann, R.A. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

For most DNA events Sandia National Laboratory has fielded pressure and time-of-arrival (TOA) measurements along the line-of-sight (LOS) pipe and in the surrounding stemming. In recent years useful data return has increased dramatically. As this technology has progressed the ability to make measurements closer and closer to the source has become feasible. The principal measurement instruments include; SLIFER cables to record shock TOA versus position, ported pressure gauges installed on the LOS pipe wall to measure the dynamic pressure of energetic LOS plasma flow, and piezioelectric stress gauges embedded in the stemming outside the LOS to measure strong shock pressures in the hundreds of kilobar range.

6488 (CONF-9309103–Vol.1, pp. 189) **The second pipe flow in the line-of-sight pipe.** Bergstresser, T. (Sandia National Lab., Albuquerque, NM (United States)); Bass, R.C. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

Explosion-generated flow in a horizontal line-of-sight (LOS) pipe is of distinctive concern to the containment community because it has been and can be a threat to the closures. The authors have evaluated the data from measurements on pipe flow in Defense Nuclear Agency-sponsored, low-yield events of the past 17 years. Most of the measurements have been made using the fluid-coupled plate gauge, with the force-plate installed flush with the interior surface of the pipe so as to measure the side-on pressure. The data set is limited to measurements in front of the muffler, if any, and away from the closed FAC (fast-acting closure). Present interest is in the second pipe flow, which originates in the crushing of the LOS pipe by ground shock. This causes jetting of material from the pipe and surrounding grout. A summary of these data is presented. They find that the peak pressures of most events, as a function of yield and range, are well-fitted by a simple formula. The outliers are discussed. In particular, the internal helix is seen to be effective in reducing the threat to closures. Similar information on the first pipe flow has already been reported. They briefly review this flow, adding data from recent events.

6489 (CONF-9309103–Vol.1, pp. 191-224) **Close-in shock wave diagnostics on MIDDLE NOTE and MISSION CYBER.** Duff, R. (S-Cubed, La Jolla, CA (United States)); McKown, T.; Eilers, D.; Storey, W.; Bass, R. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

There has long been interest in testing and confirming the calculations used to design closure systems for DNA line-of-sight (LOS)

experiments. Since the regime of relevance of these calculations is one of extreme conditions, conducting meaningful experiments is very difficult and quite expensive. As a result, relatively little data exists describing the initial stemming plug formation process. Complex arrays of CORRTEX and SLIFER cables were emplaced on MIDDLE NOTE and MISSION CYBER near the Box-A, reverse cone, and LOS pipe. These data were intended to provide heavily redundant measures of close-in shock propagation at several angles from the vertical and to thereby provide measurements that would constitute a limited test of calculations of the initial reverse-cone/pipe-closure process. A preliminary analysis of some of the data available is presented.

6490 (CONF-9309103–Vol.1, pp. 227) **The size of underground cavities formed by nuclear devices: Implications of point-source solutions for geological materials.** Holsapple, K.A. (Univ. of Washington, Seattle, WA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

Containment depends on knowledge of the size of a cavity created by a given event. Estimates are determined by the CEP equation or other scaling laws, and by prior experience. Scaling laws can be determined by point-source solutions for appropriate geological materials. The authors present point-source solutions for porous geologic materials based upon the work of Kompaneets. A discussion and complete results of the point-source solutions and the resulting scaling laws are presented. Application to the cavity formation problem gives scaling laws with a material property dependence. Implications with regard to cavity size scaling are discussed. A specific form like the CEP equation, but with exponents depending on material properties, and especially on the porosity, is obtained.

6491 (CONF-9309103–Vol.1, pp. 229-237) **GALENA pressure history and a proposed sensor for mean residual stress.** Hudson, B. (Lawrence Livermore National Lab., CA (United States)); Pratuch, S.; Heinle, R.; Hatch, M.; Stubbs, T. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

A new, light-weight, inexpensive cavity pressure system was fielded on the GALENA event. This system included a high pressure liquid pump (2500 psi, 1.5 ml/min.), a high-pressure hose extending from the instrumentation package to about 100 feet above the working point, and a stainless steel capillary tube extending from there into the expected cavity region. The system was pressurized to about 1500 psia before detonation. The resulting data suggest pressure equilibrium with the cavity region was reached within 10 s of detonation, and the subsequent pressure history, ranging from above 500 down to 40 psia, appears to be a valid measure of cavity pressure. The data acquired before 1 s suggest that the high-pressure hose performed as a pressure sensor as the initial shock wave passed over it. The authors plan to use a system similar to the one described above, without the capillary tube extending to the working point region, to sense mean residual stress on future events.

6492 (CONF-9309103–Vol.1, pp. 239-248) **Cavity gas pressure measurements on diamond fortune.** Smith, C.W. (Sandia National Labs., Albuquerque, NM (United States)); Breeze, S.P. Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract AC04-76DP00789. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

Five measurements were made of the gas pressure in the cavity as a function of time on the DIAMOND FORTUNE event. The measurements were obtained with a fast and slow blowdown technique; an additional transducer on the cavity side of the explosive valve provided valuable data. Data from three of the five transducers are nearly coincident; data from the other two show temperature-related shifts. The timeframe of the credible measurements extends from 0.1 second to four hours. The pressure at two seconds was 2,100 kPa (300 psi). On the logarithmic time scale this level decays monotonically to 210 kPa (30 psi) at 1000 seconds. During the next decade of time the cavity pressure approached atmospheric pressure. Over the initial few seconds the measured amplitude is close to the S-Cubed prediction; with increased time the measured pressure decays at a faster rate.

6493 (CONF-9309103–Vol.1, pp. 251-257) **Containment and safety data acquisition system for the LYNER complex.** Deupree, R.G. (Los Alamos National Lab., NM (United States)); Oblad, R.; Turner, W.J.; Blain, P.; Khalsa, N. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

LYNER is an underground tunnel complex constructed near the U1 a shaft designed to perform weapons related tests. A number of measurements are planned to obtain containment, environment, and safety related information. Unlike Los Alamos vertical weapons tests where data collection is performed from a trailer at the surface, containment-related data collection instrumentation will be installed in an underground alcove at one end of the complex. The authors describe the measurements they plan to make, how they expect to make them, the hardware involved, and the process by which the selection was made.

6494 (CONF-9309103–Vol.1, pp. 259-304) **Three-dimensional porous flow calculations of the LYNER concept.** Trent, B.C. (Los Alamos National Lab., NM (United States)); Travis, B.J. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

The nature of an underground testing facility for multiple-use, low-yield underground explosions is inherently three-dimensional. The boundary conditions from the blast and those from the main access drift are essentially orthogonal. To address the containment-related problems and possible solutions of the LYNER facility, an extensive series of 3-D porous flow calculations was performed. First, access drift and room/cavity dimensions were determined. Next, specific containment features, such as massive grout plugs, were incorporated into the analysis. Material properties for all geologic and containment related materials were then established. Finally, realistic pressure and tracer (radiation) boundary conditions were applied to the cavity walls. The resulting time-dependent distributions of gas-borne contamination established a baseline case. Then, several different remedial actions were investigated numerically, including time-dependent pressurization of the access drift and the emplacement of low permeability (but still leaky) doors to maintain a pressure gradient away from the "clean" access regions. The utility of such a computational capability has been to provide (at a very low cost) an "order-of-magnitude" estimate of compressed air requirements and "stand-off" distances to assure that the underground test facility can be operated with minimal risk of contamination of the entire complex. By using a porous flow code that had been tested and validated for containment-related problems (TRACR3D), the results are reasonably believable, subject to the assumptions and limitations of such an analysis. Also, the use of state-of-the-art, three-dimensional graphics capabilities, provided a unique opportunity to "see into" the problem and numerically investigate novel solutions, based on these insights which are unavailable in a two-dimensional environment.

6495 (CONF-9309103–Vol.1, pp. 305-337) **Containment related phenomenology from chemical kiloton.** Rimer, N.

(S-Cubed, La Jolla, CA (United States)); Proffer, W.; Halda, E.; Nilson, R. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 1.* 336p. Order Number DE95001257. Source: OSTI; NTIS; INIS; GPO Dep.

CHEMICAL KILOTON is a DOE/LLNL verification/nonproliferation test located in zeolitized, saturated tuff in the U12n.25 drift near MISTY ECHO, MINERAL QUARRY, and HUNTERS TROPHY. The source consists of 2.9 million lb.. (approx. 1315 metric tons) of a 50/50 ANFO/emulsion mix (10^{12} calorie energy release) in a 50 ft. diameter by 17 ft. deep "tuna can" shaped cavity (volume of approx. 980 m^3). This paper summarizes the results of a series of one- and two-dimensional calculations, which were made for DNA, of the ground motions, residual stresses, and potential for hydrofracture into an open alcove located only 52 m from the cavity wall. The numerical predictions, made using tuff material properties from the nearby MISTY ECHO event, are to be compared to anticipated SNL measurements in order to validate the computational damage models for tuff used for simulations of nuclear events. These SNL measurements to late times of both radial and hoop stress components (at peak stress levels of 0.5-1.0 kb) are intended to provide direct evidence of residual stresses in this tuff.

6496 (CONF-9309103–Vol.2, pp. 3-19) **Testbed design and analytic evaluation of a proposed very low yield DNA horizontal line-of-sight event.** Higginbotham, M.L. (S-Cubed, La Jolla, CA (United States)); Dismukes, C.R.; Sandmann, R.A. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Since the last symposium the DNA has considered the feasibility of a very low yield SREMP Horizontal Line-Of-Sight (HLOS) event. S-Cubed was asked to participate in the design and evaluation of early test-bed concepts. Non-traditional designs are required for a very low yield event because achieving total containment using mechanical closures alone is mandatory. The design goal was to decrease the threats on the closure hardware to ensure their survival. In the earliest phase of the project, attention was focused on the region within a few meters of the source. Initial designs included unusual geometries and special materials whose purpose was to divert expanding device products away from the open LOS pipe. The plan was to use the diverted energy to obliquely close the LOS pipe well ahead of the device explosion products moving toward the LOS. Although progress was made and workable designs seemed conceptually feasible, the close proximity of the source and LOS resulted in designs that were extremely sensitive to device characteristics.

6497 (CONF-9309103–Vol.2, pp. 21) **Response of steel vessels and cavity liners to dynamic loading.** Snell, C.M. (Los Alamos National Lab., NM (United States)); Swift, R.P.; Marusak, N.L.; Hill, L.R. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The use of steel vessels to fully contain explosion products is one approach for conducting high-explosive hydrodynamic experiments and zero-yield or low-yield nuclear tests. Such vessels could be free-standing, located above ground or underground, or a prestressed liner in a rock cavity utilizing the rock as an integral part of the containment system. The authors have performed a suite of one-dimensional calculations to define the dynamic response and assess containment capability of typical steel vessels. Performance was assessed as a function of the following parameters: (1) scale vessel radius and wall thickness; (2) energy source type, i.e., high-explosive and nuclear; (3) initial air pressure inside the vessel; (4) elastic and elastic-plastic behavior of the vessel; and (5) external confinement, i.e., no confinement, soft rock, and hard rock. The energy source was modeled as a uniform "pill" of the appropriate mass and energy density. The pill approximation is shown to agree with more detailed source calculations, indicating that it is adequate for the regime of interest for the containment vessel response. Calculational results are presented in the form of scaled peak strains in the vessel wall versus energy density of the source. They find that impulsive loading tends to dominate the response for massive energy sources, e.g., high-explosive (HE), and for large initial air mass in the vessel, e.g., 1 atmosphere. The late-time-quasi-static pressure becomes more important for low-mass nuclear sources and near-vacuum conditions. Peak strains are smaller for nuclear sources than for HE sources, and are significantly reduced by evacuating the vessel. Confining the vessel with rock also reduces the peak strains with best results obtained for hard rock backing. The rock confinement also serves to dampen late-time ringing of the vessel. This is important for asymmetric loading conditions and for multidimensional vessel designs.

6498 (CONF-9309103–Vol.2, pp. 23-43) **Canonical wall loading functions for decoupled cavities and containment vessels.** Snell, C.M. (Los Alamos National Lab., NM (United States)); Swift, R.P.; Marusak, N.L.; Spillman, G.R. Lawrence Livermore National Lab., CA (United States). [1993]. Airblast loading of a cavity wall by a nuclear or high-explosive detonation is of interest for containment of low-yield untamped explosions, dynamic response of containment vessels or liners, seismic decoupling by cavities, and other applications. Recent studies of the LYNER test concept and other cavity-related designs have highlighted the fact that there is no complete and internally consistent set of airblast loading functions to characterize the expected loading over a broad range of peak pressures. For cavity radii larger than about 10-15 $m/kt^{1/3}$, displacement of the wall during the loading pulse is generally small relative to the cavity radius. In this regime, the wall can be treated as a fixed or rigid boundary for the purpose of calculating the reflected airblast pressure history. The authors have performed a series of one-dimensional spherically symmetric calculations for typical nuclear and high-explosive energy sources in air-filled cavities with radii of 15 $m/kt^{1/3}$ to 295 $m/kt^{1/3}$. This encompasses a range of peak reflected pressures at the cavity wall from approximately 1000 MPa to 0.1 MPa. The calculations were run for durations of at least 0.07 $sec/kt^{1/3}$ for the smallest cavities, up to 0.9 $sec/kt^{1/3}$ for the largest cavities. This time period includes up to 25 cavity gas "bubble-bounce" oscillations for the smallest cavities. The calculational results were validated by comparison with nuclear and high-explosive free-air and reflected airblast data. These pressure-versus-time histories provide a covenient and accurate set of loading profiles that can be used for containment and cavity decoupling studies.

6499 (CONF-9309103–Vol.2, pp. 45-58) **Containing repeated low-yield nuclear explosions in steel-lined rock caverns.** Heuze, F.E. (Lawrence Livermore National Lab., CA (United States)); Swift, R.P.; Hill, L.R.; Barrett, W.H. Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. This work involved the response of a liner-bolt system installed on the wall of the DIAMOND FORTUNE cavity, a 22-m diameter nearly semi-spherical chamber in tuff, at the Nevada Test Site. DIAMOND FORTUNE is a low-yield nuclear test of the Defense Nuclear Agency which was performed in April, 1992. A 1.4-m square, 2.5-cm thick steel plate was anchored by 9-m long bolts: four 2.5-cm diameter bolts at the corners and a 5-cm diameter bolt at the center. The bolt ends daylighted in a tunnel surrounding the cavity, and were tensioned from there. The system was equipped with 20 data channels for strain, acceleration, contact pressure, and temperature. The authors related the thermal analyses and the

3-dimensional dynamic analyses performed for this project, and they present the test results which indicated the excellent response of this system to the high dynamic loads and temperatures.

6500 (CONF-9309103–Vol.2, pp. 61-85) **Distinct element modeling of late-time containment phenomena.** Proffer, W.J. (S-Cubed, La Jolla, CA (United States)); Halda, E.J. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. Ground motion predictions for underground nuclear tests are traditionally performed using finite difference models based on continuum mechanics. Calculations performed with these models show that in tamped events the plastic work done on the surrounding rock during cavity growth should produce compressive residual hoop stresses which are large enough to contain the cavity gases. Small scale laboratory and field experiments have verified that such residual stress fields are formed by explosions conducted in homogeneous materials. However, the few successful measurements obtained within the severe environments produced by nuclear events suggest that the actual residual stresses may be weaker than calculated or may decay very rapidly. It has been conjectured that the absence or reduction of residual stresses might be a consequence of the faults and joints which are present in the geologic host medium. Shear displacement of faults and joints, sometimes exceeding a meter, are routinely observed on reentry. Since these non-homogeneous discrete motions occur within the confines of the residual stress fields calculated by the continuum models, they clearly have the potential to significantly alter the formation of a confining stress field.

6501 (CONF-9309103–Vol.2, pp. 87-123) **Calculations of NTS residual stress measurements and some implications for models and material properties.** Rambo, J. (Lawrence Livermore National Lab., CA (United States)); Rimer, N. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Residual stress measurements have been obtained from several events, in particular LLNL's QUESO and ORKNEY in NTS Area 10, and DNA's HUNTERS TROPHY event in Area 12. These events employed different types of stress gauges to measure radial- and tangential-stress components. The Area 10 events show the development of compressive residual stresses. For ORKNEY, with a working point in alluvium, just above the alluvium/tuff interface, radial- and tangential-stress gauges were located at 36 and 44 m range, respectively. Since direct comparisons between the two stress measurements are complicated by stress attenuation across the 6 m separation between the two gauges, ground motion calculations were employed to aid in the evaluation of the measurements. The calculated and measured peak-stress attenuations were found to be consistent as were the times of residual stress setup and rebound, also inferred from velocity gauges located further from the working point.

6502 (CONF-9309103–Vol.2, pp. 125-144) **Calculations of the FLAX events with comparisons to particle velocity data recorded at low stress.** Rambo, J. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The FLAX event, fired in 1972, produced two particle velocity data sets from two devices in the same hole, U2dj. The data are of interest because they contain verification of focusing of a shock wave above the water table. The FLAX data show the peak velocity attenuation from the device buried in saturated tuff are different from those emanating from the upper device buried in porous alluvium. The attenuations of the peaks are different in regions traversed by both waves traveling at the same sound speed and measured by the same particle velocity gages. The attenuation rate from the lower device is due to 2-D effects attributed to wave focusing above the water table and is a feature that should be captured by 2-D calculations. LLNL's KDYNA calculations used for containment analyses have utilized a material model initially developed by Butkovich, which estimates strength and compressibility based on gas porosity, total porosity, and water content determined from geophysical measurements. Unfortunately, the material model estimates do not correctly model the more important details of strength and compressibility used for matching the velocity data. The velocity gage data contain information that can be related to the strength properties of the medium, provided that there are more than two gages recording in the stress region of plastic deformation of the material. A modification to Butkovich's model incorporated approximate strengths derived from the data. The mechanisms of focusing are discussed and incorporate additional information from the TYBO event.

6503 (CONF-9309103–Vol.2, pp. 145) **Residual stress implications due to variations of yield and depth-of-burial of two nearly simultaneous explosions.** Rambo, J.T. (Lawrence Livermore National Lab., CA (United States)); Moss, W.C.; Levatin, J.L. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Underground tests of two nearly simultaneous explosions in the same vertical hole have often been done by placing a very low yield device below a normally buried higher yield device. However, there are economics to detonating higher yield combinations in the same hole and especially to placing the lower yield device above a normally buried higher yield device. The authors have calculated the residual stress fields (RSF) for various combinations of yields and vertical device separations where the lower yield device was placed above the higher yield device. Two types of scale depth-of-burial (SDOB) criteria and various separation criteria were considered. Initially, large separation distances greater than four times the lower final-cavity radius were used to prevent contamination of tracers (nuclear chemistry requirement). Possible atypical collapse scenarios provide additional constraints that restrict the upper device to a SDOB equal to or greater than 250 $m/kt^{1/3}$. These calculations showed a poor RSF. When the nuclear chemistry constraint was relaxed (i.e., 1,2, and 3 final-cavity radii separation), a better RSF was calculated. However, for smaller separations, previous work suggests these closely spaced devices can develop high cavity pressures. Cavity merging, which could occur, but was not included in previous calculations, would alleviate the high cavity pressures. Recent calculations with closely spaced devices used a separation of 40 m, (approximately a diagnostic canister length), with various yield combinations surrounded by a generic NTS flats tuff. The close spacing required software development to merge cavities and is discussed. Calculations that demonstrate weaknesses in the RSF are shown. The calculations provide some general emplacement guidelines but site-specific material properties and geologies of actual events should be calculated for an appropriate containment analysis.

6504 (CONF-9309103–Vol.2, pp. 149-174) **Recent observations of mechanical properties and microstructure of shock-conditioned tuff.** Martin, J.W. (Univ. of Utah Research Park, Salt Lake City, UT (United States)); Fredrich, J.T.; Green, S.J. Lawrence Livermore National Lab., CA (United States). [1993]. Contract DNA 001-90-C-0169. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

"Shock-Conditioning" as used herein is a term used to indicate changes in geologic material resulting from the passage of an

explosively driven stress wave through the material. A detailed understanding of shock-conditioning may aid the containment design of underground nuclear tests, assessment of the vulnerability of underground structures, design of tunnel support, and development of constitutive models for shock damaged media. This paper documents the results of a research effort which focused on three related issues: (1) the effect of shock-conditioning on the physical and mechanical properties of NTS tuff; (2) the identification and quantification of microstructural damage in shock-conditioned tuff; and (3) the comparison of microstructural damage resulting from field (dynamic) versus laboratory (quasi-static) loading. Laboratory and microscopy studies performed on two suites of tuff retrieved from the P-tunnel complex prior to and immediately following the DISKO ELM event reveal that: (1) the shock-conditioning caused no significant change in physical properties (i.e. porosity and saturation); (2) the shear strength and the stiffness moduli of shock-conditioned tuff are significantly lowered for peak stress of 200 MPa and higher; (3) this degradation is believed to be associated with measurable microstructural damage consisting of new microcracks; (4) the microstructural damage in the form of microcracks and crushed pores which is present in tuff exposed to approximate shock levels of 200 MPa and greater increases with shock level; (5) the degradation caused by shock-conditioning (i.e. dynamic loading) is greater than that caused by quasi-static laboratory loading following the postulated field-loading path; and (6) the shock-conditioned tuff shows a more homogeneous distribution of new microcracks than the laboratory-loaded samples which exhibit strain localization for samples loaded to approximately the same peak radial stress.

6505 (CONF-9309103–Vol.2, pp. 175-190) **Properties of NTS tuff.** Thummala, V. (Materials Testing Lab., Mercury, NV (United States)); Moore, J.G.; Aamodt, J.E. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The Raytheon Services Nevada (RSN) Materials Testing Laboratory (MTL) located at the Nevada Test Site (NTS) in Mercury, Nevada has been conducting rock testing for DOE, DOD/DNA, LLNL, and LANL and for other special projects. Various NTS tuff (a volcanic rock formation) samples were tested using different methods over the years. Welded and non-welded tuff physical, mechanical, hydrologic and thermal properties are presented. The properties are sorted and summarized according to the general NTS tuff stratigraphic units. Drill holes UE19P, UE18E and samples from G-Tunnel rock property summaries and general test methods are discussed.

6506 (CONF-9309103–Vol.2, pp. 191-199) **Dynamic response of PCGC-1(O) grout.** Felice, C.W. (Mission Research Corp., Salt Lake City, UT (United States)); Ristvet, B. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results from a limited series of split-Hopkinson pressure bar (SHPB) experiments on PCGC-1(O) grout. The purpose of the experiments was to qualitatively observe the damage induced in the grout specimens due to the dynamic, high strain rate load. Besides the qualitative observations, stress-time data are presented and compared with the response obtained under static loads. In a traditional SHPB experiment, the load is generated by the impact of a projectile against the incident pressure bar. Instead of a projectile, the loading pulse in these experiments was initiated by an explosive. The explosive detonation produces a half sine wave pulse shape. The pulse is assumed to be one-dimensional, elastic and nondispersive. The explosive consisted of a blasting cap with a 0.4 gram base charge of PETN plus a 0.5 gram booster of PETN. The explosive produced a nominal incident stress of 250 MPa. The specimens were prepared from tube samples of PCGC grout supplied by the U.S. Army Engineers Waterways Experiment Station. The tube samples were nominally 50 mm in diameter. The SHPB specimens were cored to be the same diameter as the pressure bars and end ground to produce three nominal length/diameter (l/d) ratios; 0.2, 0.5 and 1.0. Two specimens were prepared at each l/d ratio. Qualitatively, the observed behavior ranged from pulverizing a zone around the edge of the specimens with the smallest l/d ratio, to slabbing at the intermediate l/d, and finally axial splitting of the specimens with the l/d ration of 1.0. The axial splitting was similar to what is observed in a static unconfined compression test.

6507 (CONF-9309103–Vol.2, pp. 203-208) **YOCOL measurement system for cavity collapse.** Deupree, R.G. (Los Alamos National Lab., NM (United States)); Turner, W.J.; Blain, P.; Flores, P.; Khalsa, N.; Macy, D. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

There are currently two ways in which the process of cavity collapse is measured on Los Alamos National Laboratory nuclear weapons tests: (1) using backfill packages to measure the gas pressure and radiation (and infrequently the acceleration) in the stemming material, and (2) using CACOL units to measure the subsurface breaking of coaxial cables. Both of these are indirect measurements of cavity collapse and occasionally give incompatible results. This has led to the devising of a more direct measurement of the stemming motion with a technique called YOCOL. The experiment follows the motion of a weight at the end of a wire from a linear transition transducer, which is expected to be tightly coupled to the motion of the stemming material.

6508 (CONF-9309103–Vol.2, pp. 209) **A radio frequency interferometer (RIF) system.** Goldwire, H.C. Jr. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe a radio frequency interferometer (RFI) system developed and tested by Lawrence Livermore National Laboratory over the last several years. The basic theory of operation, sample data, and analyzed results are presented and compared to results obtained by conventional TDR means (CORRTEX). A typical shock location measurement used for hydro-yield determination or for energy flow diagnostics comprises a coaxial sensing cable extending from the detonation region to a CORRTEX recording instrument. The single digitizer-based RFI system uses an identical sensing cable installation technique. Recording equipment consists of a CAMAC digitizer module, which produces a sinusoidal probing signal (the signal sent downhole) for each sensing channel (cable), while also coherently sampling the phase of the reflected signal. Each channel is recorded using a single digitizer, providing maximal temporal and spatial resolution, but independent of channel gain or quadruture errors inherent to dual digitizer systems. Interpolation software with suitable look-ahead logic permits determination of complete quadruture information using a single digitizer. This RFI system provides several times better spatial resolution and two orders of magnitude better temporal sampling density than does CORRTEX. It also is less susceptible to electromagnetic pulse distortion and provides a direct means for identifying (and rejecting) any data so contaminated.

6509 (CONF-9309103–Vol.2, pp. 213-224) **Review and analysis of stemming practices at LLNL with consideration of slumping phenomena.** Cornell, R.H. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear*

explosions. Volume 2. 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Established LLNL practices for stemming and granular materials do not seem to be completely based on analytical or measured criteria. However, data from field experiments and analytical work by a number of investigators indicate that the established standards are conservative regarding stemming-induced over-pressure and granular stemming flow past restrictive annuli. Experimental data indicates that the falling speed of granular stemming is materially less than the expected terminal velocity. This implies the existence of significant wall energy losses for falling stemming. It is difficult to assess how stemming rates effect the potential of slumping. Increasing the stemming rate has been observed to increase the emplaced bulk density of the stemming bed. Higher bulk densities reduce the potential size of a slump. However, increased stemming rate increases downhole air pressure. Increased air pressure is though to be a factor in the production of slumps. These competing characteristics form a subject for further study and experiment. The need exists to develop a method for selecting an optimum stemming rate that will minimize or eliminate slumping potential while still keeping within maximum pressure and restricted area flow allowances.

6510 (CONF-9309103–Vol.2, pp. 225-241) **Polyurethane foam cable bundle block.** Mercier, J.A. (Lawrence Livermore National Lab., CA (United States)); Cornell, R.H.; Pratuch, S.M.; Lundberg, A. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Blocking the flow of radioactive gas in the emplacement hole requires attention to three items: the stemming materials, the cables, and the spaces between the cables. This paper deals with an improvement in the latter; that is, filling the spaces between the cables and, thus, forming a bundle block. The authors have tested a two-part polyurethane foam in the field with apparent success. Field tests included recovery of sample cable bundles from a nuclear test in a tunnel. The foam creates a bundle block that survives the shock loading and improves the resistance to gas flow by as much as a factor of 3.

6511 (CONF-9309103–Vol.2, pp. 243-273) **Field permeability and strength tests of LANL grout and TPE plugs.** Trent, G.C. (Los Alamos National Lab., NM (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Several full-scale pressurization experiments were performed on LANL rigid plug materials to determine resistance to gas pressures. In particular, a new candidate grout, HPNS-5, has been proposed to replace certain applications of two-part epoxy (TPE) plugs. The testing procedure consisted of placing pressure transducers within coarse and fines layers between two rigid plugs. Air was then forced into the coarse layer and the resulting time-dependent pressures were monitored. During emplacement of the test plugs and layers of fine and coarse stemming materials, every effort was made to follow as closely as possible actual stemming procedures used full scale emplacements. The effect of ground shock and slap down were investigated by performing a similar series of experiments in the rack assembly hole for the JUNCTION event. To determine the strength characteristics of PHNS-5, a structural frame was used to load the wire harnesses after the permeability tests were completed. The experimental data from all these experiments are presented and their implications for underground nuclear testing are discussed.

6512 (CONF-9309103–Vol.2, pp. 275-295) **A summary of LLNL containment: Diagnostics data, 1985-1993.** Hudson, B.; Stubbs, T. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

For normally buried underground nuclear tests, the site and depth of burial are chosen so that no radioactive material is expected at the surface as a result of leakage through the surrounding overburden media. Concurrently, the emplacement hole is stemmed so that it is not expected to provide a leakage path to the surface. Beginning with the GOLDSTONE event (12/85), the LLNL has used a system of granular stemming layers and sanded gypsum concrete (SGC) plugs for stemming emplacement holes. The major objective of this report is to summarize the containment-related performance of these plugs. A typical stemming plan is shown. Two types of diagnostics are used to confirm that plugs have been emplaced and have performed as designed: conductivity and temperature for emplacement; pressure and radiation for performance. The conductivity and temperature probes are used to monitor plug location, thickness, and temperature histories. The latter provides information concerning the strength of the plug material. While probe data have, on occasion, shown deviations between the designed and the as-built stemming column, no deviation indicated a compromise which would degrade SGC plug performance. Consequently, these data are not discussed in this report. Pressure and radiation sensors are placed between the plugs to indicate impedance to gas flow; EXCOR (EXtended CORrtex, a continuous, time-domain reflectometer) and motion sensors are used to indicate plug structural integrity (as a stemming platform) during collapse. Containment experience since beginning the use of SGC plugs has been satisfactory, i.e., no radioactive material has been detected at the surface during the first 24 hours after a detonation. They therefore conclude that currently employed methods and materials used for stemming emplacement holes have been adequate. However, performance-related data suggest that significant improvements in stemming reliability might be achievable.

6513 (CONF-9309103–Vol.2, pp. 297-311) **More RAMS data for selected LANL events.** Trent, B.C. (Los Alamos National Lab., NM (United States)); Marusak, N.L. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The data presented at the Sixth Containment Symposium has been updated to provide additional records on measured pressure and radiation from downhole remote area monitoring station (RAMS) packages. The updates include, as before, complete stemming diagrams as well as the locations of all monitor stations. Data is provided for all tests conducted since the last symposium. The collection of this data will reside in an existing database management system which will enhance the flexibility for analysis and comparison of different RAMS package time-histories.

6514 (CONF-9309103–Vol.2, pp. 315-345) **In situ convergence measurements and initial analysis from mine-by experiments in U12P and U12N tunnels at the Nevada Test Site, Nye County, Nevada.** Harris-West, B.L.; Fogel, M.B. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Quantifying the tunnel convergence phenomenon (the relaxation or displacement that occurs around a newly mined drift) is important for understanding the character and stress field of the in situ medium. Both of these factors are instrumental in modeling containment and structure response, and in determining support requirements for construction. A new technique was used during continuous mining of drifts in two tunnel complexes in 1988-1990 to actively measure and record when and where tunnel convergence occurred in relation to the mined face. For the first experiment, an electromechanical gauge was installed at the collar of each of six holes drilled to varying depths perpendicular to the

existing (Bypass) drift to measure displacement as mining proceeded by in the parallel (Main) drift. Over a four-day period in 1988, a 33.2-meter (109-foot) section of the U12p.03 Main drift was mined from 7.6 meters (25 feet) on the portal side of the first gauge anchor, located at the bottom of the hole, to more than 7.6 meters (25 feet) on the far side of the last gauge anchor. Data were recorded every 1 to 5 minutes, depending on the proximity of the face to the plane of the anchors. Longer term data were recorded every 2 hours for an additional 34 days.

6515 (CONF-9309103–Vol.2, pp. 363-397) **Use of a simple constitutive model for volcanic rocks of the southwestern Nevada volcanic field for the determination of hugoniots in testing media of the Nevada Test Site.** Olinger, B. (Los Alamos National Lab., NM (United States)); Fritz, J.N.; Warren, R.G.; Chipera, S.J. Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-36. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The authors' analysis of the known chemical and physical characteristics of Tertiary volcanic rocks of the southwestern Nevada volcanic field (SWNVF) indicates that rock alteration is the most important geologic consideration for shock-wave propagation. Volcanic rock chemistry is unusually consistent within the SWNVF as rhyolite, so chemical variation among and within volcanic units does not appear to significantly affect shock wave character. The three common alterations (vitric, devitrified, and zeolitic) appear to have consistent mineral assemblages throughout the SWNVF, and therefore each alteration type shows consistent physical properties throughout the SWNVF. In addition to alternation, porosity and degree of water saturation are important factors for shock-wave propagation. Rock porosity is strongly related to its lithology (e.g., lava, welded tuff), and degree of saturation is generally related to proximity to the water table. They obtained large samples from well-characterized vitric, devitrified, and zeolitic zones of the Topopah Spring Tuff, a rhyolitic, phenocryst-poor unit of the SWNVF. They measured shock-wave compression in each of these samples using explosive-driven systems that compared shock velocities in the rock samples with velocities in aluminum standards. Measurements have been repeated, artificially varying degrees of saturation and porosity to include the in situ range observed of saturation and porosity observed in Tertiary volcanic rocks of NTS subsurface.

6516 (CONF-9309103–Vol.2, pp. 399-406) **A comparison of the moisture gauge and the neutron log in air-filled holes at NTS.** Hearst, J.R. (Lawrence Livermore National Lab., CA (United States)); Carlson, R.C. Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Two methods are commonly used to measure water content of geologic materials by neutron diffusion. One is used mostly in agricultural, mining and civil engineering areas and is called a moisture gauge. The other is used principally in petroleum and mineral exploration, and is called a neutron log. Both are used at NTS, the moisture gauge principally in tunnels, the neutron log in vertical drilled holes. There is little communication between the two industrial groups, and the measurement instruments have evolved with very different operational characteristics, and one important physics difference, the source to detector spacing. The moisture gauge has a very short, 0-6 cm, spacing, with little internal shielding, and count increases with water. In contrast, the neutron log has a long spacing, 30-50 cm, substantial internal shielding, and exhibits decreasing count with increasing water. Because of its short spacing the moisture gauge gives better bed resolution than the neutron log. Because its count increases with water, the moisture gauge is more strongly affected by water in the borehole, especially in dry formations. In these conditions the neutron log is the method of choice. In air-filled holes, if source size or logging time is not a constraint, the relative sensitivity of the two tools to water is determined by the relative strengths of borehole effects as fluid, holesize, or tool-wall gap. If source size is a constraint for safety reasons, the short spacing provides higher countrates for a given detector efficiency and thus better relative precision in determining the true count. If source size is limited because of detector or electronics saturation, the short spacing will be better at high water content, while the long spacing will be better at low water content. In any case the short spacing may have an advantage because it can make better contact with the hole wall and it can be more easily corrected for gap.

6517 (CONF-9309103–Vol.2, pp. 407-412) **Maximum likihood borehole corrections for dual-detector density logs.** Carlson, R.C. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Dual-detector density logs have been used in the petroleum industry for years. The tool was designed with a second detector to allow compensation for the effect of a layer of mudcake between the tool and the formation being measured. The compensation algorithm commonly used calculates the correction to apply to the density measured by the long-spaced detector as proportional to the difference in the densities measured by the two detectors. The coefficient of proportionality is determined from experimental data taken with the tool in a fluid-filled hole of 15 to 40 cm diameter, with uniform thickness sheets of various materials simulating the mudcake. In applying this technology for the Containment program at the Department of Energy Nevada Test Site (NTS) the authors have discovered two problems. First, they frequently log in air-filled holes much larger than 40 cm. Correlations between the corrected data and the amount of correction applied suggest that the standard algorithm undercorrects in these circumstances. Second, the gap, or layer, is rarely uniform with depth or vertical position on the face of the tool. They have found that when the source end of the tool makes better contact with the wall than the detector end, the standard algorithms will undercorrect the data. When the reverse is true, the algorithm can overcorrect the data. They have developed a method to determine the proper amount of correction dynamically. No experimental data on the gap effect are needed as long as the two detectors are calibrated to read the proper density when the gap is zero. The method assumes that the form of the equation used in the standard algorithm is correct, but uses the variation of the two density signals with depth to determine the appropriate value of the coefficient, assuming true density varies more slowly than the gap effects.

6518 (CONF-9309103–Vol.2, pp. 413-418) **An in-situ check of the epithermal neutron log calibration.** Burkhard, N.R. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. DOE Contract W-7405-ENG-48. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The epithermal neutron log is used to measure the water content of the formation. The large hole epithermal neutron sonde (ENS) utilized at the Nevada Test Site (NTS) has been calibrated in the Hydrogen Content Test Facility (HCTF). These calibrations are used to correct the measured neutron count rate for the effects of tool stand-off and density. For some time, the suspicion has existed that the water contents that are calculated from the ENS data are too large. Hole U2gj represented a unique opportunity to check the validity of the ENS calibration under realistic logging conditions; a portion of the hole had been cemented and redrilled and then logged. The cements have a known water content and can be used as an in-situ calibration check. The author found that the water contents from the log data after processing with the existing

calibrations are consistent with these known cement water contents. In addition, the study indicates that the raw neutron data might be more appropriately smoothed by using a median smoother rather than the currently utilized mean smoother.

6519 (CONF-9309103–Vol.2, pp. 429) **Soil mounds at the Nevada Test Site: Natural or nuclear?.** Garcia, M.N. (Geological Survey, Denver, CO (United States)); Covington, H.R. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Pahute Mesa occupies the northwest portion of the Nevada Test Site (NTS) and ranges in elevation from about 1760 to 2230 m. It is composed of welded ash-flow tuffs and rhyolite lavas. Soil mounds have been observed in the field and on aerial photographs of the mesa that were taken prior- and subsequent-to subsurface nuclear testing. The mounds are commonly composed of loose, unstratified sediment and are surrounded by gravel at their bases. They range from 3 to 6 m in diameter, are generally less than 1 m in height, and are hemispherical. The mounds are most abundant on flat mesa surfaces, and they have not been observed on slopes greater than 15 degrees or in areas where the soil is sufficiently thick to support trees. Preliminary photogrammetric maps of the mesa show that the mounds form on mesa ridges where thin surficial material overlies thin welded ash-flow tuffs. No mounds have been observed on thick welded ash-flow tuffs or on rhyolite lavas. The origin of the mounds may be due in part to three natural causes: the burrowing of small animals along natural and nuclear-induced fractures, vegetation serving as traps for eolian sediment, and frost action. A fourth factor may be seismicity. A seismic explanation has been suggested for the origin of similar mounds in Washington State. The seismic explanation suggests that the mounds in Washington State formed where ground shaking affected unconsolidated fine sediments on a relatively rigid planar substratum. It is unclear whether the mound formation on Pahute Mesa coincided with either natural or nuclear-induced seismicity. Soil mounds have been observed on some aerial photographs that predate subsurface nuclear testing. Currently, studies are in progress to determine if mound shape and distribution have changed as a result of subsurface nuclear testing.

6520 (CONF-9309103–Vol.2, pp. 431) **Water-level map of eastern Pahute mesa and vicinity, Nevada Test Site, Nye County Nevada.** O'Hagen, M.D. (IT Corp., Las Vegas, NV (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

A water-level contour map of Eastern Pahute mesa and vicinity, Nevada Test Site, Nye County, Nevada was constructed using water levels measured in seventy-three drill holes. The water level map supports previous conceptualizations of ground-water movement beneath eastern Pahute Mesa. The drill holes were emplaced in volcanic rocks of the Silent Canyon Caldera complex, the Timber Mountain caldera and adjacent areas. Depth-to-water measurements range from 852 to 2,336 feet below land surface. Water-level altitudes range from 4,904 feet in the eastern part to 4,190 feet in the southeastern part of the map area. Within the Silent Canyon Caldera complex a northeast to southwest groundwater flow direction is indicated by the water-level contours. A north-south lateral ground-water flow barrier is located coincident with the western boundary of the Silent Canyon caldera complex. The barrier is defined on the basis of a steep hydraulic gradient resulting in higher water levels measured in drill holes located west of the caldera complex. West of the barrier, a north-south groundwater flow direction is indicated by the water-level contours. Anomalously high water levels in the eastern, central and southwestern map area are identified. The anomalous water levels may represent perched or semiperched conditions. Alternatively, the anomalous water levels may indicate transient perturbations of the ground-water system caused by underground nuclear testing.

6521 (CONF-9309103–Vol.2, pp. 433) **Groundwater levels from well and test-hole data, Yucca Flat, Nevada Test Site, Nye County, Nevada, 1959-91.** Hale, G.S. (Geological Survey, Las Vegas, NV (United States)); Trudeau, D.A. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

Groundwater levels at the Nevada Test Site, 65 miles northwest of Las Vegas, Nevada, have been affected by underground nuclear testing. Water-level data collected from wells and test holes during April 1959 through December 1991 in the Yucca Flat area are being evaluated by the U.S. Geological Survey, in cooperation with U.S. Department of Energy for their nuclear-test and environmental-assessment planning. These water-level data are being used to construct a water-table-altitude map by evaluating the location of wells and test holes, water-level measurements, the location of the contact between Paleozoic and Cenozoic rocks at the water table, and the generalized hydrostratigraphic (Paleozoic or Cenozoic) unit contributing water at each well or test hole. This information updates the map by Doty and Thordarson (1983), Water table in rocks of Cenozoic and Palezoic Age, 1980, Yucca Flat, Nevada, U.S. Geological Survey Water-Resources Investigations Report 83-4067. Within the Cenozoic rock of central Yucca Flat, the number of delineated groundwater mounds and the areal extent of mounding have increased since 1980. Generally, groundwater altitudes are higher in the Cenezoic rock of central Yucca Flat than in the underlying and adjacent Paleozoic carbonate rock. A more precise interpretation of groundwater flow in Yucca Flat is limited by sparse 1991 data, composite water-level data (the well or test hole is open to more than one hydrostratigraphic unit within saturated Paleozoic and Cenozoic rock), and the effects of nuclear testing on water levels. These limitations prevent an accurate interpretation of groundwater flow direction within Yucca Flat.

6522 (CONF-9309103–Vol.2, pp. 435) **An electromagnetic hole separation survey tool.** Goldwire, H.C. Jr. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe an electromagnetic survey tool developed by others, which can be used to accurately determine the offset distances between various points in nearby emplacement holes or adits (e.g., the satellite hole offset from an emplacement hole at the device horizon in a vertical geometry emplacement). The technique was demonstrated on a vertical event at the Nevada Test Site. The basic theory of operation, sample data, and analyzed results are presented and compared to results obtained by conventional survey means.

6523 (CONF-9309103–Vol.2, pp. 437-445) **Destruction of chemical weapons by underground nuclear explosions.** Morel, B.; Black, S. Lawrence Livermore National Lab., CA (United States). [1993]. From 7. symposium on containment of underground nuclear explosions; Kent, WA (United States); 13-17 Sep 1993. In *Proceedings of the seventh symposium on containment of underground nuclear explosions. Volume 2.* 431p. Order Number DE95001250. Source: OSTI; NTIS; INIS; GPO Dep.

After several decades, the negotiation of a ban on production, possession and use of chemical weapons was completed in Geneva this summer. An important provision of the treaty is that the parties have ten years to destroy the chemical warfare agents and chemical weapons deployed on their territories. In contrast to the frenzy of other post-cold war demilitarization efforts, chemical weapons destruction presents significant unresolved technical and economic problems to a large number of states. Specific solutions may not be universally accepted because of technical, economic,

and societal differences. In particular, the use of underground nuclear detonations was dismissed in the West but is being examined by Russian scientists. The destruction of chemical weapons is more difficult and more expensive than their manufacture. In addition to their extreme toxicity, the high explosive bursting charge contained in many of the munitions adds a significant degree of difficulty. There have been many suggestions for industrial scale destruction of chemical weapons. The cost, difficulty and efficiency of these approaches vary, but none seem ideal. This article examines the feasibility of destroying chemical weapons with underground nuclear explosions.

The U.S. DOE sponsored research investigating atmospheric infrasound as a means of detecting both atmospheric and underground nuclear tests. Various detection schemes were examined and were found to be effective for different situations. It has been discovered that an enhanced sensitivity is realizable for the very lowest frequency disturbances by detecting the infrasound at the top of the atmosphere using radio sound techniques. These techniques are compared to more traditional measurement schemes.

6526 (LA-UR–94-3736) **Effects of carbon blending and granule size layering on butane breakthrough curves.** Wood, G.O. (Los Alamos National Lab., NM (United States)); Karwacki, C. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411158–1: 1994 U.S. Army Edgewood Research conference on development and Engineering (ERDEC), Edgewood, MD (United States), 15-18 Nov 1994). Order Number DE95003726. Source: OSTI; NTIS; GPO Dep.

Butane breakthroughs of packed granulated carbon beds were studied to provide information for the design of longer lasting gas mask canisters. Breakthrough curve data for 1,000 ppm butane were obtained and analyzed for adsorption capacities, rates and asymmetry parameters. Two commercial carbons with granules in the 12–30 mesh size range were used: (1) a chromium-free, impregnated carbon, ASZM-T, and (2) and unimpregnated activated carbon, BPL. These carbons were blended and layered in a 3:1 ratio, respectively, by volume to determined effects on adsorption capacities and rates. Six replicate layered beds (with the BPL layer downstream) and seven replicate blended beds of the carbons showed no statistical differences in rates or capacities. The ASZM-T carbon was separated into fractions in the 12–16, 16–20, and 20–30 mesh size ranges and used to prepare layered beds for testing. Keeping the total bed volume the same, backup layers of the smaller sized carbons increased adsorption rates up to 50%. However, because of the dominance of the capacity in determining breakthrough time, corresponding 1% butane breakthrough times increased only up to 6%.

6527 (CONF-9406275–1) **Evaluation of the performance of an annular diffusion denuder.** Fan, B.J.; Cheng, Y.S.; Yeh, Hsu-Chi. Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. From Conferencce on obscuration and aerosol research; Aberdeen, MD (United States); 2-5 Jun 1994. Order Number DE95002258. Source: OSTI; NTIS; GPO Dep.

In air sampling, an annular diffusion denuder (ADD) is often used to trap specific gases from an air sample stream. The efficiency of an ADD in collecting a gas was considered in this study. A dimensional analysis showed that the collection efficiency depended on two parameters: the Peclet number and the annulus radii ratio. To determine collection efficiency, we calculated the fractional loss of the gas inside the denuder. In the calculation, the governing equations for gas concentration and flow field inside the annulus were solved numerically. After validating the methodology, a parameteric calculation of the collection efficiency was made, and a one-equation model based on the calculation was developed. A comparison of the model and experimental data showed a variance coefficient of 3.26%. This confirmed that the performance of an annular denuder could be evaluated by this model.

6528 (DOE/ER/61100–1) **Vertical array receptions of the Heard Island transmissions.** Baggeroer, A.B. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Lashkari, K.; Chiu, Ching-sang; Miller, J.H.; Mikhalevsky, P.; von der Heydt, K. Woods Hole Oceanographic Institution, MA (United States). 23 Mar 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER61100. Order Number DE94013784. Source: OSTI; NTIS; GPO Dep.

The Heard Island Feasibility Test (HIFT) demonstrated that coded acoustic signals could be detected at ranges up to 18,000 km with currently available source technology. This paper describes one component of the HIFT where a large aperture vertical line array was deployed to record the signals transmitted from Heard Island. We have performed four analysis Of the VLA receptions, of the Heard Island signals. All four suggest the presence of higher order modes. The frequency- vertical wavenumber analysis and the modal beamforming indicate that mode 3 has the highest amplitude while the modal fitting suggests that made 5–6 are largest. It is difficult to resolve the differences since the SNR at the VLA, nearly 18,000 km with a transmission loss of around 145 dB, is quite low. Individual arrivals could not be distinguished because of the long integration time necessitated by the low SNR.

6529 (DOE/ER/61206–3) **Atmospheric peroxides. Technical progress report.** Weinstein-Lloyd, J. State Univ. of New York, Old Westbury, NY (United States). Aug 1994. 12p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract FG02-91ER61206. Order Number DE95004435. Source: OSTI; NTIS; INIS; GPO Dep.

The research conducted in this program has furthered the development of a method for real-time analysis of hydrogen peroxide, methyl hydroperoxide, and hydroxymethyl hydroperoxide, the most abundant peroxides in the atmosphere. The Fenton method was used in a number of major field studies and the results used to test models of atmospheric photochemistry and observed diurnal profiles have shed light on the mechanism of formation of H2O2 and organic peroxides. The technique has also been adapted for analysis of peroxides in precipitation in an undergraduate analytical chemistry/instrumental analysis course.

6530 (DOE/ER/61728–T1) **Laboratory studies of the sensitivity of tropospheric ozone to the chemistry of sea salt aerosol. Final report, September 15, 1993–September 14, 1994.** Finlayson-Pitts, B.J. California State Univ., Fullerton, CA (United States). 15 Nov 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER61728. Order Number DE95003607. Source: OSTI; NTIS; GPO Dep.

Ozone plays a critical role in both the chemistry and radiation balance of the troposphere. Understanding the factors controlling tropospheric ozone levels is critical to our understanding of a variety of issues in global chemistry and climate change. Chlorine atoms have the potential to contribute significantly to the ozone balance in the free troposphere. They can react directly with ozone or alternately, with organics and may actually lead to the formation of ozone in the presence of sufficient NO. Reactions of alkali halides in sea salt particles are a potential source of atomic chlorine, hence reactions of these alkali halides, especially those producing precursors to atomic chlorine, are of great interest. Finally, the mechanisms, intermediates and products of the Cl-biogenic reactions are unknown; these could serve as unique markers of chlorine atom chemistry in the troposphere, and hence are important to define.

6531 (ETDE/DE-mf–95726722) **Air pollution monitoring system in Lower Saxony. Data record on air quality in Lower Saxony 1978-1992.** Niedersaechsisches Landesamt fuer Oekologie, Hannover (Germany). Abt. Immissionsschutz. [1993]. 109p. (In German). Order Number DE95726722. Source: OSTI; NTIS (US Sales Only).

The purpose of this report is to present the detailed results of the monthly and annual reports compiled in the course of the fifteen years under review in such a way as to make visible the development and current situation of air pollution in Lower Saxony. This is achieved by depicting quantities characterising the main pollutants and making time series analyses and spatial differentiations. Air pollution with sulphur dioxide and dust has markedly decreased over the past five years. The implemented emission abatement measures were enhanced by favourable meteorological conditions, keeping these pollutant concentrations within the guide and limit values of the relevant WHO and EC directives. On the other hand, air pollutants emitted by motor vehicles such as nitrogen dioxide, benzene, and the secondary product ozone are attaining increasing significance. Concentrations of these pollutants have not yet decreased much. These developments should be taken into account in determining national, European and intercontinental standards of air pollution control. (orig.)

6532 (ETDE/DE-mf–95726974) **Highly volatile chlorinated hydrocarbons in Lower Saxony. Pt. 1. Production and application. Short version.** Technischer Ueberwachungs-Verein Hannover e.V. (Germany). Sep 1989. 55p. (In German). Sponsored by Umweltministerium des Landes Niedersachsen, Hannover (Germany). Order Number DE95726974. Source: OSTI; NTIS (US Sales Only).

According to the survey 90% of the losses of CFC's are incurred by emissions, about 5% are contained in poisonous wastes which are treated separately, 1-2% get into the waste water. 60-80% of the CFC's which contaminate waste water are stripped again usually in purification plants and emitted into the atmosphere as gas. The annual consumption of CFC's is therefore an indicator of the amounts of chlorinated hydrocarbons emitted annually by the users. The close coincidence of consumption and emission does, however, not apply to plants which give used chlorinated hydrocarbons to external companies for processing (e.g. metal processing plants, contents of encapsulated degreasing plants). (orig./EF)

6533 (INIS-mf–15070) **Anthropogenic climate change: Knowledge - decision - action.** Hoppenau, S. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)). Behoerde fuer Schule, Jugend und Berufsbildung, Hamburg (Germany). Nov 1993. 32p. (In German). Order Number DE95726738. Source: OSTI; NTIS (US Sales Only); INIS.

The paper points out areas where climate research has established facts relevant to the issue of man's influence on climate. It also discusses which details in the current picture may yet be modified. In order to arrive at a valuation one must know how reliable are the research results obtained until now. If the global emission of greenhouse gases continues, climate change will be inevitable. If emissions continue over the long term, be it even at a constant level, then the climate will change at a rate and to an extent for surpassing all natural climate fluctuations. A management of civilisation that is based at all levels on continued and increasing greenhouse gas emission, therefore, causes lasting damage to the natural basis of our lives, the ecosystem of the Earth. The uncertainties that still remain from the climatological aspect even though they may be profound in some details, do not relieve politicians of their responsibility to act immediately. This, however, presupposes a consensus on ethical criteria of assessment. (orig.)

6534 (INIS-mf–15073) **Sensitivity study of land biosphere CO_2 exchange through an atmospheric tracer transport model using satellite-derived vegetation index data.** Report - Max-Planck-Institut fuer Meteorologie, v. 127. Knorr, W.; Heimann, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Feb 1994. 26p. Order Number DE95726897. Source: OSTI; NTIS (US Sales Only); INIS.

We develop a simple, globally uniform model of CO_2 exchange between the atmosphere and the terrestrial biosphere by coupling the model with a three-dimensional atmospheric tracer transport model using observed winds, and checking results against observed concentrations of CO_2 at various monitoring sites. CO_2 fluxes are derived from observed greenness using satellite-derived Global Vegetation Index data, combined with observations of temperature, radiation, and precipitation. We explore a range of CO_2 flux formulations together with some modifications of the modelled atmospheric transport. We find that while some formulations can be excluded, it cannot be decided whether or not to make CO_2 uptake and release dependent on water stress. It appears that the seasonality of net CO_2 fluxes in the tropics, which would be expected to be driven by water availability, is small and is therefore not visible in the seasonal cycle of atmospheric CO_2. The latter is dominated largely by northern temperate and boreal vegetation, where seasonality is mostly temperature determined. We find some evidence that there is still considerable CO_2 release from soils during northern-hemisphere winter. An exponential air temperature dependence of soil release with a Q_{10} of 1.5 is found to be most appropriate, with no cutoff at low freezing temperatures. This result is independent of the year from which observed winds were taken. This is remarkable insofar as year-to-year changes in modelled CO_2 concentrations caused by changes in the wind data clearly outweigh those caused by year-to-year variability in the climate and vegetation index data. (orig.)

6535 (INIS-mf–15074) **Some sensitivities of a coupled ocean-atmosphere GCM.** Report - Max-Planck-Institut fuer Meteorologie, v. 128. Stockdale, T. (European Centre for Medium Range Weather Forecasts (ECMWF), Reading (United Kingdom)); Latif, M.; Burgers, G.; Wolff, J.O. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Feb 1994. 30p. Order Number DE95726896. Source: OSTI; NTIS (US Sales Only); INIS.

A coupled ocean-atmosphere GCM is being developed for use in seasonal forecasting. As part of the development work, a number of experiments have been made to explore some of the sensitivities of the coupled model system. The overall heat balance of the tropics is found to be very sensitive to convective cloud cover. Adjusting the cloud parameterization to produce stable behaviour of the coupled model also leads to better agreement between model radiative fluxes and satellite data. A further sensitivity is seen to

changes in low-level marine stratus, which is under-represented in the initial model experiments. An increase in this cloud in the coupled model produces a small improvement in both the global mean state and the phase of the east Pacific annual cycle. The computational expense of investigating such small changes is emphasized. An indication of model sensitivity to surface albedo is also presented. The sensitivity of the coupled GCM to initial conditions is investigated. The model is very sensitive, with tiny perturbations able to determine El Nino or non-El Nino conditions just six months later. This large sensitivity may be related to the relatively weak amplitude of the model ENSO cycle. (orig.)

6536 (INIS-mf–15075) **Interdecadal variability in a global coupled model.** Report - Max-Planck-Institut fuer Meteorologie, v. 125. Storch, J.S. von. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Jan 1994. 25p. Order Number DE95726899. Source: OSTI; NTIS (US Sales Only); INIS.

Interdecadal variations are studied in a 325-year simulation performed by a coupled atmosphere - ocean general circulation model. The patterns obtained in this study may be considered as characteristic patterns for interdecadal variations. 1. The atmosphere: Interdecadal variations have no preferred time scales, but reveal well-organized spatial structures. They appear as two modes, one is related with variations of the tropical easterlies and the other with the Southern Hemisphere westerlies. Both have red spectra. The amplitude of the associated wind anomalies is largest in the upper troposphere. The associated temperature anomalies are in thermal-wind balance with the zonal winds and are out-of-phase between the troposphere and the lower stratosphere. 2. The Pacific Ocean: The dominant mode in the Pacific appears to be wind-driven in the midlatitudes and is related to air-sea interaction processes during one stage of the oscillation in the tropics. Anomalies of this mode propagate westward in the tropics and the northward (southwestward) in the North (South) Pacific on a time scale of about 10 to 20 years. (orig.)

6537 (IVL-B–1154) **Levels of SO_2, soot (black smoke), NO_2 and VOC in ambient air in Swedish urban areas, together with SO_2 and NO_2 at neighbouring rural sites, winter 1993-1994.** Svanberg, P.A. (Swedish Environmental Research Inst., Gothenburg (Sweden)); Bostroem, C.E.; Backstroem, H. Swedish Environmental Research Inst., Goeteborg (Sweden). 1994. 123p. (In Swedish). Order Number DE95723988. Source: OSTI; NTIS.

The report presents the results from the 8th consecutive measurement campaign within the URBAN project. During the campaign, October 1993-March 1994, measurements were carried out in 32 different urban areas. The measurements are based mostly on 24 hour average concentrations of sulphur dioxide, soot and nitrogen dioxide in each of the urban centres. In addition, for 24 of the participating boroughs, monthly measurements of SO_2 and NO_2 at two sites in rural areas neighbouring the urban areas were undertaken. For the second consecutive year the project included measurements of volatile organic compounds at 22 of the urban areas. The subsequent analyses included the determination of 8 components; benzene, toluene, m- + p-xylene, o-xylene, ethyl benzene, butyl acetate, octane and nonane. The results have been compiled together with the corresponding meteorological data. In addition, the results from background air measurements at the Swedish sites within the EMEP network are presented. Besides the conventional presentation of results with comparison with the national air quality standards, linear correlation tests between the measured parameters, meteorological data and even other general data supplied by the boroughs concerning population, traffic work etc. are reported. The regional and long distance transport background contributions for air quality in the urban areas, as well as the variations within the urban areas have been discussed on the basis of the obtained results. In this year's evaluation, the Swedish Environmental Protection Agency's decision concerning the introduction of ambient air standards has been considered. In addition, the report also describes the results achieved concerning: The method development concerning the testing of a 'NO_x' diffusion sampler; Reproducibility tests on diffusion samplers for VOC; and Active 24 hour sampling of VOC. 21 refs, numerous figs and tabs

6538 (KFK–5242) **Ground based measurements of relevant trace gases for studying the ozone chemistry in the Arctic stratosphere using Fourier transform spectrometers.** Thomas, P.; Clarmann, T. v.; Blumenstock, T.; Fischer, H.; Gerhardt, L.; Gulde, T.; Oelhaf, H.; Scheuerpflug, W.; Stiller, G.P.; Trieschmann, O.; Wegner, A. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Meteorologie und Klimaforschung. Mar 1994. 32p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01VOZ15. Order Number DE95733152. Source: OSTI; NTIS (US Sales Only).

This is the final report of a project, which was funded by the German Federal Ministry for Research and Technology (BMFT), file No. 01 V0Z15 6, and was conducted from 1 March, 1990 until 30 June, 1993. It was the goal of the project to record zenith column amounts (ZCA's) of trace gases, which are relevant to ozone chemistry and to the development of ozone sinks in the Arctic. Above all, the contribution of dynamic and chemical processes was to be clarified as well as the question whether parallels can be drawn between the chemistry of the Arctic and the Antarctic stratosphere. The equipment used were two Fourier transform spectrometers (FTS). They allow the IR spectrum of direct sunlight to be measured which is attenuated selectively by the atmospheric trace gases, dependent on their concentrations. To be able to calculate the ZCA's, synthetic spectra are fitted to the measured ones taking into account the measuring geometry, and by varying vertical profiles of the mixing ratios used to calculate the synthetic spectra. An advantage offered by this measuring technique is that the ZCA's of many trace gases can be determined simultaneously in the same probed mass of air. (orig.)

6539 (NEI-DK–1740) **Measurement of aerosols.** Simonsen, O. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Sep 1989. 8p. (In Danish). Contract ENS-1223/90-0033. Order Number DE95723839. Source: OSTI; NTIS.

EFP-90.

A brief description of some methods for measuring sulphuric acid clouds. The methods could be used in relation to laboratory experiments to demonstrate a mathematical model for the formation of aerosols. (AB)

6540 (NEI-DK–1741) **Aerosol kinetics. A description of formation, growth and coagulation of mist droplets.** Simonsen, O. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Inst. for Kemiteknik. Mar 1990. 22p. (In Danish). Contract ENS-1223/90-0033. Order Number DE95723840. Source: OSTI; NTIS.

EFP-90.

A short summary of work on mathematical models for the description of the formation, growth and coagulation of mist droplets in aerosols. (AB) (18 refs.)

6541 (NEI-NO–442) **Monitoring artificial radioactivity in the Nordic countries. BER-2 final report.** Bennerstedt, T.; Rantanen, H.; Mortensen, B.N. No corporate text available. May 1994. 5p. (CONF-9405256–: Nordic seminar on emergency preparedness in nuclear accidents, Oslo (Norway), 4-6 May 1994). Order Number DE95609818. Source: OSTI; NTIS (US Sales Only); INIS.

This final report of the Nordic Nuclear Safety Research Project BER-2 gives detailed information on the monitoring of artificial radioactivity in the Nordic countries (Denmark, Finland, Iceland, Norway and Sweden). A comparison shows that for early warning the Nordic countries use a mix of stations measuring external gamma radiation and stations measuring airborne radioactivity. There is a trade-off between fast alarms and the sensitivity threshold. Total gamma measuring stations cannot detect increases smaller than the variations of normal background. Some stations, notably all Danish stations, are equipped with sodium iodide (NaI) type detectors, and operated in such a way that stray peaks due to an increase in the natural radon background can be subtracted. A Nordic Radiation Data Exchange System has been set up and tested on a trial basis. This system focuses on dose rate data from the automatic gamma monitoring stations. An important goal achieved in the project was to determine which data is essential, and to specify a common format for the data exchange. Various telecommunication methods have been tested, and the actual transfer of monitoring results between the Nordic countries was started. It is recommended as a future approach that every country

appoint one organization with the responsibility of operating a national information data base, which can be commonly accessed from all the Nordic countries. A procedure for establishing a system of this type has been outlined.

6542 (ORNL/CDIAC–65) **Trends '93: A compendium of data on global change.** Boden, T.A.; Kaiser, D.P.; Sepanski, R.J.; Stoss, F.W.; Logsdon, G.M. (eds.). Oak Ridge National Lab., TN (United States). Sep 1994. 1031p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ESD–4195). Order Number DE95004456. Source: OSTI; NTIS; GPO Dep.

This document provides synopses of frequently used global-change data. This third issue of the Trends series presents historical and modern records of atmospheric concentrations of carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), two chlorofluorocarbons (CFC-11 and CFC-12), a hydrochlorofluorocarbon (HCFC-22), and two halons (H-1301 and H-1211) from an expanded number of globally distributed data sets. Virtually all of the modern records extend into the 1990s, some into 1994. Additional trace gas data presented in Trends '93 include historical atmospheric CO_2, CH_4, and N_2O records derived from ice cores. Trends '93 also includes revised and updated estimates through 1991 for global, regional, and national CO_2 emissions produced from the burning of fossil fuels, gas flaring, and the production of cement. Updated global emissions estimates through 1992 are also presented for CFC-11 and CFC-12. In addition, Trends '93 updates and expands the presentation of long-term temperature records, whose spatial coverage ranges from an individual Antarctic (ice core) site to the entire globe and from the Earth's surface to the lower stratosphere. New subject matter appearing in Trends '93 includes a chapter for long-term regional precipitation records, several time-series records for atmospheric - ^{14}C aerosols, and isotopic measurements for atmospheric CO_2 from several sites. Data records are presented in multipage formats, each dealing with a specific site, region, or emissions species. The data records include tables; graphs; discussions of methods for collecting, measuring, and reporting the data; trends in the data, and references to literature providing further information. Instructions for citing specific data in Trends '93 are provided for each compiled data set. All data appearing in Trends '93 are available on digital media from the Carbon Dioxide Information Analysis Center (CDIAC).

6543 (SAND–94-8699C) **Tunable diode lasers as continuous emission monitors for thermal waste treatment processes.** Allendorf, S.W. (Sandia National Labs., Livermore, CA (United States)); Ottesen, D.K.; Johnsen, H.A.; Wang, J.; Frish, M.D.; Trembley, D.G.; Severance, R.; Boni, A.A. Sandia National Labs., Livermore, CA (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. (CONF-940528–7: Incineration conference: 13th international symposium on thermal treatment technologies, Houston, TX (United States), 9-13 May 1994). Order Number DE95004381. Source: OSTI; NTIS; GPO Dep.

In this paper the ongoing program to develop and apply a family of on-line process monitors is described. This technique detects molecular gas-phase species by optical absorption using vibrational transitions in the near-infrared region. Near-infrared, tunable diode lasers are used that emit extremely narrow, single-mode radiation. Current efforts include laboratory work to identify the optimum absorption lines for the molecular species of interest. Sensors based on tunable diode lasers are being developed in parallel with this scoping work. One such instrument, designed to monitor ammonia, has been constructed and field-tested; its specification and performance are discussed.

6544 (SVF–514) **Evaluation of SNCR-systems in steam- and hot water boilers in Sweden.** Gromulski, J. (Vattenfall Utveckling AB, Vaellingby (Sweden)); Hinderson, A.; Johansson, Annika; Sfiris, G.; Sjoeberg, M.; Westermark, M. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Oct 1994. 153p. (In Swedish). Order Number DE95723969. Source: OSTI; NTIS.

Figures and tables with text in English.

SNCR (Selective Non-Catalytic Reduction) is a method for removing nitrogen oxides that has attracted a lot of attention and has been installed at several plants, both in Sweden and abroad. The chemical basis for the method is the reaction of nitrogen compounds having a large hydrogen content (e.g. ammonia, urea) with nitrogen oxides, resulting in the formation of nitrogen. The maximum removal is obtained when the reducing chemical is injected at a point where the fuel gas temperature is 870-1010 degrees C. This report is a summary of the results of a comprehensive study supported financially by NUTEK (Swedish National Board for Industrial and Technical Development), Svensk Energi Utveckling AB (Swedish Energy Development Corporation), Vattenfall AB (the largest Swedish power supplier), Vaermeforsk (Thermal Engineering Research Inst.) and the participating plants. The project has involved seven Swedish plants, where the environmental, operational and economic characteristics of the SNRC process have been evaluated. The reported operating experience from the plants indicate that the method is fairly simple and does not require a great deal of surveillance and service. In most cases there is no need to add personnel and no great changes in the maintenance routines have to be made. The SNCR systems have not caused production problems at any of the plants studied. The most commonly reported problem seems to be nozzle congestion, which requires some surveillance and cleansing. Nozzle congestion can also cause varying injection performance, which may in turn lead to less removal, higher ammonia emissions and increased risk of furnace corrosion. 23 refs, 115 figs, 8 tabs

6545 (SVF–518) **Evaluation and comparison of different techniques for monitoring ammonia in flue gas.** Johansson, Annika (Vattenfall Utveckling AB, Vaellingby (Sweden)); Harnevie, H.; Axelsson, H. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Oct 1994. 111p. (In Swedish). Project Vaermeforsk-B1-317. Order Number DE95723970. Source: OSTI; NTIS.

Figures and tables with text in English.

Since the introduction of $deNO_x$ processes based on injection of ammonia or urea, the determination of ammonia in flue gases has been associated with a lot of uncertainty. Measurement results achieved with different techniques have often given poor agreement with each other, which has led to difficulties for performance evaluations of SCR/SNCR installations. The aim of this project has been to clarify some of the reasons for the observed discrepancies between different measurement techniques. The work has been limited to measurement techniques for gaseous ammonia in clean gas. A general conclusion from testing of continuous measurement systems is that both IR and UV systems can be considered well suited for ammonia analyses in most flue gas applications. However, discrepancies between different measuring systems were found, but these are more likely to be due to the individual instrument design than to a certain measuring principle. Factors such as function of the instrument's specific evaluation routines, calibration routines, the construction of the sampling system etc proved to be of great importance for the instrument's performance. The analyses results from the wet chemical measurements were often in good agreement with the results from the continuous measurement systems, although some tests that gave very different results. From this data, some recommendations for wet chemical analyses have been proposed. One conclusion from the intercalibration is that all of the examined analysis methods (i.e. the indophenol method, ion chromatography and the salicylate method) are well suited for ammonium analyses, provided that the analyses are carried out properly. 20 refs, 39 figs, 27 tabs

6546 (UCRL-JC–118477) **Remote sensor test range update.** Slaughter, D. Lawrence Livermore National Lab., CA (United States). Jul 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–15: 1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95003629. Source: OSTI; NTIS; GPO Dep.

It has been recognized since the beginning of the CALIOPE remote sensor development program that performance criteria must be developed to measure progress and efficacy, then prototype sensors must be evaluated against them. Much of the early evaluation may be carried out cost effectively in the laboratory and at field ranges located near each of the participating national laboratories. However, sensor performance is expected to be degraded

by many factors in the field at remote sites and the extent of that degradation must be quantified before instruments can be designed and constructed for international deployment. LLNL proposed a series of field tests for this purpose at the Remote Sensor Test Range (RSTR) located at the Nevada Test Site (NTS). Well-controlled gas plumes containing mixtures of important species at known concentration would be released to the open atmosphere and used as targets for the prototype remote sensors. The plume dimensions and gas concentrations will be well diagnosed to provide "ground truth". Gases selected as targets will, in the beginning, be chosen to optimize instrument performance in the field and identifying those factors that limit performance. The initial experiments will use ground based-instruments observing the target plumes from relatively close range. Field tests will evolve toward gases identified by the "signatures study" (McDowell, Aldis, Elder-Session II these proceedings) as relevant to proliferant activity. Target concentrations will be reduced to those expected in proliferant scenarios and may be modulated in time. Observation range will be increased, and elevated or airborne sensor platforms will be introduced.

6547 (DOE/EM–0224) **Summary report of a workshop on phytoremediation research needs.** USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States). (CONF-9407155–Summ.: Workshop on phytoremediation research needs, Santa Rosa, CA (United States), 24-26 Jul 1994). Order Number DE95006076. Source: OSTI; NTIS; INIS; GPO Dep.

Soil contamination is a national and global problem. A major challenge is the remediation of large sites contaminated with radionuclides and toxic metals, often present in relatively small amounts but above regulatory action levels. Despite the function of phytoremediation processes in nature for millenia, the technology of phytoremediation is, for the most part, still a concept. There are many different pollutants, plant uptake mechanisms, soil matrices, and plant species that need to be investigated, without overlooking the microbial participation in this technology. Developing actual practical applications will require a significant and coordinated research and development effort, due to the complexity of both biological systems and the soil contamination problems. Research and development in this area must involve scientists and engineers in Federal and state agencies, foreign organizations and industry. The representation at the workshop of researchers from many disciplines, organizations and countries, augurs well for a cooperative and interdisciplinary research effort and the rapid application of this technology. The urgent needs for effective, low-cost technologies to clean-up contaminated soils, both in the US and around the world, suggests phytoremediation as a high national and international research priority. The availability of scientists trained in the interdisciplinary topics relating to phytoremediation will be a major factor in expediting development of this technology.

6548 (DOE/MC/29467–3939) **Decontamination Systems Information and Research Program: Quarterly report, July–September 1994.** National Research Center for Coal and Energy, Morgantown, WV (United States). Nov 1994. 377p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95000033. Source: OSTI; NTIS; INIS; GPO Dep.

West Virginia University (WVU) and the US DOE Morgantown Energy Technology Center (METC) entered into a Cooperative Agreement on August 29, 1992 entitled "Decontamination Systems Information and Research Programs" (DOE Instrument No.: DE-FC21-92MC29467). Stipulated within the Agreement is the requirement that WVU submit to METC a series of Technical Progress Reports on a quarterly basis. This report comprises the eighth Quarterly Technical Progress Report for the Agreement. This report reflects the progress and/or efforts performed on the 16 technical projects encompassed by the Agreement for the period of July 1 through September 30, 1994. These projects focus on the following: Bio-remediation of organic compounds, heavy metals, and radionuclides; miscellaneous remediation technologies; instrumentation; and technology assessments.

6549 (DOE/SR/18271–T1) **Degradation of mix hydrocarbons by immobilized cells of mix culture using a trickle fluidized bed reactor. Final report: June 1992–June 1994.** Chapatwala, K.D. Selma Univ., AL (United States). Div. of Natural Sciences. [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-92SR18271. Order Number DE95003819. Source: OSTI; NTIS; GPO Dep.

The microorganisms capable of degrading mix hydrocarbons were isolated from the soil samples collected from the hydrocarbon contaminated sites. The mix cultures were identified as Pseudomonas acidovorans, Flavobacterium indoltheticum and Phyllobacterium rubiaceum. The bacterial cells of mix cultures were immobilized in calcium-alginate solution in the form of beads. A trickle fluidized bed air-uplift-type reactor designed to study the degradation of mix hydrocarbons was filled with 0.85% normal saline containing the immobilized cells of mix culture. The immobilized beads were aerated with different amounts of CO_2-free air. The normal saline saturated with BTXs was circulated in the bioreactors at the rate of 2–4 ml/min. The biodegradation of BTXs by the immobilized beads of mix culture was monitored by determining the concentrations of the BTXs and the metabolites formed during their degradation in the samples at regular intervals using GC. The peaks obtained through the degradation of BTXs were not identified and quantified in this study.

6550 (EGG–11265-2035) **The effect of drought on four plant communities in the northern Mojave Desert.** Schultz, B.W. (Desert Research Inst., Reno, NV (United States)); Ostler, W.K. EG and G Energy Measurements, Inc., Las Vegas, NV (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-93NV11265. (CONF-9310276–12: 8. wildland shrub and arid land restoration symposium, Las Vegas, NV (United States), 19-21 Oct 1993). Order Number DE95004166. Source: OSTI; NTIS; GPO Dep.

Desert plant communities contain many perennial plant species that are well adapted to arid environments; therefore, one would intuitively believe that perennial desert species readily survive drought conditions. Abundant research on plant-soil-water relationships in North American deserts has shown that many species can maintain water uptake and growth when the soil-water potential is low. Little research, however, has focused on how prolonged drought conditions affect plant species in vegetation associations in desert ecosystems. A prolonged and widespread drought occurred in much of the western United States, including the Northern Mojave Desert, from 1987 through 1991. During this drought period vegetation characterization studies, initiated in 1990, by the US Department of Energy (DOE) at Yucca Mountain, Nevada, allowed EG and G Energy Measurements to collect data that could be used to infer how both desert vegetation associations and desert plant species reacted to a prolonged drought. This paper presents the preliminary results.

6551 (GKSS–94/E/6) **Mapping of pollutants in sediments of the German Wadden Sea - June, 1989 to June, 1992. Final report January 1993.** Koopmann, C. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Physik); Faller, J.; Bernem, K.H. van; Prange, A.; Mueller, A. GKSS-Forschungszentrum Geesthacht GmbH (Germnay). Jan 1994. 160p. (In German). Sponsored by Umweltbundesamt, Berlin (Germany). Contract UFOPLAN 10903377. (UBA-FB–93-109). Order Number DE95726118. Source: OSTI; NTIS (US Sales Only); INIS.

From June 1989 to June 1992 a mapping of inorganic and organic pollutants in the sediments from the entire German Wadden Sea has been carried out. Following the guidelines of the national (Bund/Laender-Messprogramm) and international monitoring programmes for the North Sea (Joint Monitoring Programme) distribution patterns of pollutants according to their type and concentration have been determined in the course of this investigation

and the main pollution areas have been established. Based on the results of the mapping of pollutants, as well as on the first findings of the biological mapping, a concept for the monitoring of pollutants in eulittoral sediments of the German Wadden Sea has been developed. (orig.)

6552 (GRI–94/0037) **Pipeline corridors through wetlands - impacts on plant communities: Bayou Grand Cane, De Soto Parish, Louisiana. Topical report, August 1991–July 1993.** Shem, L.M. (Argonne National Lab., IL (United States)); Zimmerman, R.E.; Hayes, D.; Van Dyke, G.D. Argonne National Lab., IL (United States). Dec 1994. 54p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Source: OSTI; Gas Research Institute, 8600 West Bryn Mawr Ave., Chicago, IL 60631.

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipeline on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and night of-way (ROW) management practices. This report presents the results of a survey conducted over the period of August 12-13, 1991, at the Bayou Grand Cane crossing in De Soto Parish, Louisiana, where a pipeline constructed three years prior to the survey crosses the bayou through mature bottomland hardwoods. The sit was not seeded or fertilized after construction activities. At the time of sampling, a dense herb stratum (composed of mostly native species) covered the 20-m-wide ROW, except within drainage channels. As a result of the creation of the ROW, new habitat was created, plant diversity increased, and forest habitat became fragmented. The ROW must be maintained at an early stage of succession to allow access to the pipeline however, impacts to the wetland were minimized by decreasing the width of the ROW to 20 m and recreating the drainage channels across the ROW. The canopy trees on the ROW's edge shaded part of the ROW, which helped to minimize the effects of the ROW.

6553 (GRI–94/0226) **Pipeline corridors through wetlands - impacts on plant communities: Bayou Pointe Aux Chenes, Terrebonne Parish, Louisiana. Topical report, August 1991–April 1994.** Van Dyke, G.D.; Shem, L.M.; Zimmerman, R.E. Argonne National Lab., IL (United States). Dec 1994. 40p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Order Number DE95004390. Source: OSTI; Gas Research Institute, 8600 West Bryn Mawr Ave., Chicago, IL 60631; NTIS; GPO Dep.

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and night- of-way management practices. This report presents the results of a survey conducted on August 22, 1991, in an emergent intertidal estuarine wetland in Terrebonne Parish, Louisiana. The site includes three pipelines installed between 1958 and 1969. Vegetation within the site comprises three native tidal marsh grasses: Spartina alterniflora, Spartina patens, and Distichlis spicata. All three species occurred over the pipelines, within the right-of-way and in both natural areas. Vegetative differences attributable to the installation or presence of the pipelines were not obvious over the pipelines or in the habitat east of the pipelines. However, because of the presence of a canal west of the 1969 pipeline, vegetation was less abundant in that area, and D. spicata was absent from all but the most distant plots of the transacts. Data obtained in the study indicate that when rights-of-way through brackish marsh are restored to their original elevations, they are revegetated with native vegetation similar to that in surrounding areas.

6554 (INIS-JP–024, pp. B450/1-B450/11) **Measuring techniques for environmental natural radiation. Neutron and Radon α-rays.** Sato, Hiroo (Aloka Co. Ltd., Mitaka, Tokyo (Japan)). Japan Atomic Industrial Forum, Inc., Tokyo (Japan); Japan Radioisotope Association, Tokyo (Japan); Atomic Energy Society of Japan, Tokyo (Japan). 1994. 596p. (In Japanese). (CONF-940268–: 21. Japan conference on radiation and radioisotopes, Tokyo (Japan), 2-4 Feb 1994). In *Proceedings of the 21st Japan conference on radiation and radioisotopes. The 100th year since the discovery of X-ray, and expectation to the future development.* Order Number DE94785275. Source: OSTI; NTIS; INIS.

This review covers a neutron pocket dosimeter and monitor for the detection of radiation quantities above the environmental radiation level, and a compact readout Radon monitor. (author).

6555 (JAERI-Research–94-010) **Environmental simulation test for radionuclide migration under wet-dry cycle condition in aerated zone.** Tanaka, Tadao (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Yamamoto, Tadatoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 38p. (In Japanese). Order Number DE95737225. Source: OSTI; NTIS; INIS.

Influence of discontinuous water flow based on repeated cycle of rainfall and evaporation (wet-dry cycle condition) on the migration behavior of ^{60}Co, ^{85}Sr and ^{137}Cs in a sandy soil layer has been demonstratively investigated by using the equipment of environmental simulation test for radionuclide migration, in order to establish a reliable evaluation method of the radionuclide migration in natural barrier, in relation to the safety assessment on shallow land disposal of low-level radioactive waste. Migration velocity of cationic ^{85}Sr, concentrations of particulate ^{60}Co and ^{137}Cs in the deeper soil layer, pH and ion concentration dissolved in the soil layer under the wet-dry cycle condition became larger than those under the continuous flow condition. Increase of the migration velocity of cationic ^{85}Sr under the wet-dry cycle condition was attributed to that the concentration of Ca^{2+}, by which the sorption ability of ^{85}Sr onto soils was reduced, increased in interstitial water during an interruption period of water flow. On the other hand, the migration velocity of cationic ^{60}Co and ^{137}Cs was not affected by the wet-dry cycle condition. Increase of the concentration of particulate ^{60}Co and ^{137}Cs under the wet-dry cycle condition was probably caused from that movable $\{^{60}Co(OH)_2\}_n$ and ^{137}Cs fixed on fine soil particles were produced during the interruption period. (author).

6556 (JAERI-Research–94-014) **Radionuclide transfer onto ground surface in surface water flow. 2. Undisturbed tuff rock.** Mukai, Masayuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Takebe, Shinichi; Komiya, Tomokazu. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1994. 32p. (In Japanese). Order Number DE95737267. Source: OSTI; NTIS; INIS.

Radionuclide migration with ground surface water flow is considered to be one of path ways in the scenario for environmental migration of the radionuclide leaked from LLRW depository. To study the radionuclide migration demonstratively, a ground surface radionuclide migration test was carried out by simulating radioactive solution flowing on the sloped tuff rock surface. Tuff rock sample of 240 cm in length taken from the Shimokita district was used to test the transfer of ^{60}Co, ^{85}Sr and ^{137}Cs onto the sample surface from the flowing radioactive solution under restricted infiltration condition at flow rates of 25, 80, 160ml/min and duration of 56h. The concentration change of the radionuclides in effluent was nearly constant as a function of elapsed time during the experimental period, but decreased with lower flow rates. Among the three radionuclides, ^{137}Cs was greatly decreased its concentration to 30% of the inflow. Adsorbed distribution of the radionuclides concentration on the ground surface decreased gradually with the distance from the inlet, and showed greater gradient at lower flow rate. Analyzing the result by the migration model, where a vertical advection distribution and two-dimensional diffusion in surface water are adopted with a first order adsorption reaction, value of migration parameters was obtained relating to the radionuclide adsorption and the surface water flow, and the measured distribution could be well simulated by adopting the value to the model. By comparing the values with the case of loamy soil layer, all values of the migration parameters showed not so great difference between two samples for ^{60}Co and ^{85}Sr. For ^{137}Cs, reflecting a few larger value of adsorption to the tuff rock, larger ability to reduce the concentration of flowing radioactive solution could be indicated than that to the loamy soil surface by estimation for long flowed distance. (author).

6557 (LA-SUB–94-167) **Modeling erosion and transport of depleted uranium, Yuma Proving Ground, Arizona.** Ward, T.J.; Stevens, K.A. New Mexico State Univ., Las Cruces, NM (United States). New Mexico Water Resources Research Inst. Jun 1994. 86p. Sponsored by Department of Defense, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. (WRRI–286). Order Number DE95003451. Source: OSTI; NTIS; GPO Dep.

The high density, relative abundance, and metallic properties have made depleted uranium (DU) an obvious choice for high energy ballistic projectiles. The U.S. Army's Yuma Proving Ground (YPG) in southwest Arizona tests DU projectiles. When DU projectiles strike a target or the downrange ground surface, they fragment. Most of the fragments are collected after the test firings, but some are either too small or too dispersed to be easily found. Unfortunately, DU has some undesirable characteristics, it is a radioactive material (alpha particle emitter) and a toxic metal. Therefore, the fragments not found pose a potential environmental hazard at the YPG and to surrounding areas. The U.S. Army has contracted with the Los Alamos National Laboratory (LANL) to study the fate of DU at the YPG. In turn, LANL has contracted with New Mexico State University (NMSU) to investigate water transport of DU during rainfall-runoff events. Nine simulation runs were made on YPG soil containing DU fragments from the impact areas. The nine simulations consisted of three groups of three: rainfall simulation only, overland flow only, and rainfall/overland flow combination. Infiltration rates in the DU ballistic impact areas at YPG were very close to zero. Larger concentrations of DU were contained in the impact area soil which was retained by the 1 mm and 0.5 mm sieves when grain-size analysis was performed. After all nine simulations were completed, a mass balance of the uranium showed most DU remained in the soil box even under extreme hydraulic conditions, though about 7% (by weight) did exit the box. No DU was found in the suspended sediment samples and this suggests that most transport of DU is restricted to contact or bedload movement during overland flow. Because the experiments were conducted to simulate extreme rainfall-runoff conditions, the probability of significant transport of DU from land surface appears to be low.

6558 (LA-UR–94-3833) **Frijolito Watershed: Integrated investigations of a rapidly eroding pinyon-juniper hillslope.** Wilcox, B.P. (Los Alamos National Lab., NM (United States)); Pitlick, J.; Allen, C.D. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411157–1: Semiarid hydrology conference, Tucson, AZ (United States), 1-3 Nov 1994). Order Number DE95003689. Source: OSTI; NTIS; INIS; GPO Dep.

The dramatic acceleration of erosion associated with the expansion of pinyon-juniper woodlands over the past 100 years has been widely recognized, but few process-based studies of this phenomenon have been undertaken. In an attempt to identify the underlying causes, and the factors that affect erosion processes, we have initiated an interdisciplinary study of a rapidly eroding pinyon-juniper woodland in northern New Mexico. Since July 1993, we have collected data on runoff, erosion, and weather conditions from a 1-ha catchment study area and have conducted surveys of topography, soils, and vegetation. Our preliminary results indicate that although runoff makes up less than 10% of the annual water budget, runoff events - which are frequent in the summer - are capable of moving large amounts of sediment. We estimate that between July 1993 and October 1994, between 25,000 and 50,000 kg of sediment has eroded and been transported from the catchment. The information gained from such studies is essential to our ability to formulate effective strategies for managing these rapidly eroding woodlands.

6559 (LBL–36086) **A TOUGH2 equation-of-state module for the simulation of two-phase flow of air, water, and a miscible gelling liquid.** Finsterle, S. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.); Moridis, G.J.; Pruess, K. Lawrence Berkeley Lab., CA (United States). May 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95004816. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

The injection of grout into the subsurface can be used to encapsulate contaminated regions of an aquifer, or to form underground barriers for the isolation of contaminant sources and to prevent the spreading of existing plumes. This requires identifying grouts, or barrier fluids, which when injected into the subsurface exhibit a large increase in viscosity and eventually solidify, sealing the permeable zones in the aquifer. Simulation and modeling analysis are indispensable tools for designing the injection and predicting the performance of the barrier. In order to model flow and transport in such systems, the thermophysical properties of the fluid mixtures have to be provided, and the governing mass- and energy-balance equations for multiphase flow in porous media have to be solved numerically. The equation-of-state module EOS11 described herein is an extension of the EOS7 module of the TOUGH2 code for flow of saline water and air. In the modeling approach, the chemical grout is treated as a miscible fluid the viscosity of which is a function of time and concentration of the gelling agent in the pore water. If a certain high viscosity is reached and the movement of the grout plume ceases, the gel is assumed to solidify, leading to a new porous medium with changed soil characteristics, i.e. reduced porosity and permeability, increased capillary strength for a given water content, and changed initial saturation distribution.

6560 (LBL–36088) **Optimizing multiphase aquifer remediation using ITOUGH2.** Finsterle, S. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.); Pruess, K. Lawrence Berkeley Lab., CA (United States). Jun 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95004817. Source: OSTI; NTIS; GPO Dep.

The T2VOC computer model for simulating the transport of organic chemical contaminants in non-isothermal multiphase systems has been coupled to the ITOUGH2 code which solves parameter optimization problems. This allows one to use nonlinear programming and simulated annealing techniques to solve groundwater management problems, i.e. the optimization of multiphase aquifer remediation. This report contains three illustrative examples to demonstrate the optimization of remediation operations by means of simulation-minimization techniques. The code iteratively determines an optimal remediation strategy (e.g. pumping schedule) which minimizes, for instance, pumping and energy costs, the time for cleanup, and residual contamination. While minimizing the objective function is straightforward, the relative weighting of different performance measures–e.g. pumping costs versus cleanup time versus residual contaminant content–is subject to a management decision process. The intended audience of this report is someone who is familiar with numerical modeling of multiphase flow of contaminants, and who might actually use T2VOC in conjunction with ITOUGH2 to optimize the design of aquifer remediation operations.

6561 (NEI-SE–161) **Radioactive cesium in boreal forest ecosystems.** Palo, T. (Swedish Univ. of Agricultural Sciences, Umeaa (Sweden). Dept. of Forest Zooecology); Bergman, R.; Nylen, T. Swedish Univ. of Agricultural Sciences, Umeaa (Sweden). Dept. of Animal Ecology. [1994]. 13p. (In Swedish). Project SSI-P756.93; SSI-P757.93. Order Number DE95610897. Source: OSTI; NTIS; INIS.

The report describes the migration, transfer and radioecological concentration of radioactive cesium in boreal forests. 17 refs, 6 figs.

6562 (ORNL/ER–68) **Groundwater quality monitoring well installation for Lower Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** Mortimore, J.A.; Lee, T.A. Oak Ridge National Lab., TN (United States). Sep 1994. 263p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95002289. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the drilling and installation of 11 groundwater quality monitoring (GQM) wells on the perimeter of Lower Waste Area Grouping (WAG) 2. Lower WAG 2 consists of White Oak Lake and the embayment below White Oak Dam above the

Clinch River. The wells in Lower WAG 2 were drilled and developed between December 1989 and September 1990. These wells were installed to characterize and assess the WAG in accordance with applicable Department of Energy, state, and Environmental Protection Agency regulatory requirements. The wells at Lower WAG 2 were drilled with auger or air rotary rigs. Depending on the hydrogeologic conditions present at each proposed well location, one of three basic installation methods was utilized. Detailed procedures for well construction were specified by the Engineering Division to ensure that the wells would provide water samples representative of the aquifer. To ensure conformance with the specifications, Energy Systems Construction Engineering and ERCE provided continuous oversight of field activities. The purpose of the well installation program was to install GQM wells for groundwater characterization at Lower WAG 2. Data packages produced during installation activities by the ERCE hydrogeologists are an important product of the program. These packages document the well drilling, installation, and development activities and provide valuable data for well sampling and WAG characterization. The forms contained in the packages include predrilling and postdrilling checklists, drilling and construction logs, development and hydraulic conductivity records, and quality control-related documents.

6563 (ORNL/ER–73) **Groundwater quality monitoring well installation for Waste Area Grouping at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program.** Mortimore, J.A.; Lee, T.A. Oak Ridge National Lab., TN (United States). Sep 1994. 323p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95002288. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the drilling and installation of 18 groundwater quality monitoring (GQM) wells on the perimeter of Waste Area Grouping (WAG) 11. WAG 11 (White Wing Scrap Yard) is located on the west end of East Fork Ridge between White Wing Road and the Oak Ridge Turnpike. The scrap yard is approximately 25 acres in size. The wells at WAG 11 were drilled and developed between January 1990 and October 1990. These wells were installed to characterize and assess the WAG in accordance with applicable Department of Energy, state, and Environmental Protection Agency regulatory requirements. The wells at WAG 11 were drilled with auger or air rotary rigs. Depending on the hydrogeologic conditions present at each proposed well location, one of four basic installation methods was utilized. Detailed procedures for well construction were specified by the Engineering Division to ensure that the wells would provide water samples representative of the aquifer. To ensure conformance with the specifications, Energy Systems Construction Engineering and ERCE provided continuous oversight of field activities. The purpose of the well installation program was to install GQM wells for groundwater characterization at WAG 11. Data packages produced during installation activities by the ERCE hydrogeologists are an important product of the program. These packages document the well drilling, installation, and development activities and provide valuable data for well sampling and WAG characterization. The forms contained in the packages include predrilling and postdrilling checklists, drilling and construction logs, development and hydraulic conductivity records, and quality control-related documents.

6564 (PNL–10180) **Environmental settings for selected U.S. Department of Energy installations - support information for the Programmatic Environmental Impact Statement.** Holdren, G.R.; Glantz, C.S.; Berg, L.K.; Delinger, K.; Goodwin, S.M.; Rustad, J.R.; Schalla, R.; Schramke, J.A. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 380p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005255. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the environmental setting information developed for 20 U.S. Department of Energy (DOE) installations in support of the DOE's Programmatic Environmental Impact Study (PEIS). The objective of the PEIS is to provide the public with information about the types of radiological and hazardous wastes and environmental contamination problems associated with major DOE facilities across the country, and to assess the relative risks that these wastes pose to the public, onsite workers, and the environment. Environmental setting information consists of the site-specific data required to model (using the Multimedia Environmental Pollutant Assessment System) the atmospheric, groundwater, and surface water transport of contaminants within and near the boundaries of the installations. The environmental settings data describes the climate, atmospheric dispersion, hydrogeology, and surface water characteristics of the installations. The number of discrete environmental settings established for each installation was governed by two competing requirements: (1) the risks posed by contaminants released from numerous waste sites were to be modeled as accurately as possible, and (2) the modeling required for numerous release sites and a large number of contaminants had to be completed within the limits imposed by the PEIS schedule. The final product is the result of attempts to balance these competing concerns in a way that minimizes the number of settings per installation in order to meet the project schedule while at the same time providing adequate, if sometimes highly simplified, representations of the different areas within an installation. Environmental settings were developed in conjunction with installation experts in the fields of meteorology, geology, hydrology, and geochemistry. When possible, local experts participated in the initial development, fine tuning, and final review of the PEIS environmental settings.

6565 (PSI–94-12) **INTRAVAL Finnsjoen Test - modelling results for some tracer experiments.** Jakob, A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hadermann, J. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. 82p. Order Number DE95610898. Source: OSTI; NTIS; INIS.

This report presents the results within Phase II of the INTRAVAL study. Migration experiments performed at the Finnsjoen test site were investigated. The study was done to gain an improved understanding of not only the mechanisms of tracer transport, but also the accuracy and limitations of the model used. The model is based on the concept of a dual porosity medium, taking into account one dimensional advection, longitudinal dispersion, sorption onto the fracture surfaces, diffusion into connected pores of the matrix rock, and sorption onto matrix surfaces. The number of independent water carrying zones, represented either as planar fractures or tubelike veins, may be greater than one, and the sorption processes are described either by linear or non-linear Freundlich isotherms assuming instantaneous sorption equilibrium. The diffusion of the tracer out of the water-carrying zones into connected pore space of the adjacent rock is calculated perpendicular to the direction of the advective/dispersive flow. In the analysis, the fluid flow parameters are calibrated by the measured breakthrough curves for the conservative tracer (iodide). Subsequent fits to the experimental data for the two sorbing tracers strontium and cesium then involve element dependent parameters providing information on the sorption processes and on its representation in the model. The methodology of fixing all parameters except those for sorption with breakthrough curves for non-sorbing tracers generally worked well. The investigation clearly demonstrates the necessity of taking into account pump flow rate variations at both boundaries. If this is not done, reliable conclusions on transport mechanisms or geometrical factors can not be achieved. A two flow path model reproduces the measured data much better than a single flow path concept. (author) figs., tabs., 26 refs.

6566 (PSI–94-13) **Grimsel Test Site: modelling radionuclide migration field experiments.** Heer, W. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hadermann, J. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. 137p. Order Number DE95610899. Source: OSTI; NTIS; INIS.

In the migration field experiments at Nagra's Grimsel Test Site, the processes of nuclide transport through a well defined fractured shear-zone in crystalline rock are being investigated. For these experiments, model calculations have been performed to obtain indications on validity and limitation of the model applied and the data deduced under field conditions. The model consists of a hydrological part, where the dipole flow fields of the experiments are determined, and a nuclide transport part, where the flow field driven nuclide propagation through the shear-zone is calculated. In addition to the description of the model, analytical expressions are given to guide the interpretation of experimental results. From the

analysis of experimental breakthrough curves for conservative uranine, weakly sorbing sodium and more stronger sorbing strontium tracers, the following main results can be derived: (i) The model is able to represent the breakthrough curves of the migration field experiments to a high degree of accuracy, (ii) The process of matrix diffusion is manifest through the tails of the breakthrough curves decreasing with time as $t^{-3/2}$ and through the special shape of the tail ends, both confirmed by the experiments, (iii) For nuclide sorbing rapidly, not too strongly, linearly, and exhibiting a reversible cation exchange process on fault gouge, the laboratory sorption coefficient can reasonably well be extrapolated to field conditions. Adequate care in selecting and preparing the rock samples is, of course, a necessary requirement. Using the parameters determined in the previous analysis, predictions are made for experiments in a smaller an faster flow field. For conservative uranine and weakly sorbing sodium, the agreement of predicted and measured breakthrough curves is good, for the more stronger sorbing strontium reasonable, confirming that the model describes the main nuclide transport processes adequately. (author) figs., tabs., 29 refs.

6567 (SAND–91-1526) **Benchmark testing and independent verification of the VS2DT computer code.** McCord, J.T. (Sandia National Labs., Albuquerque, NM (United States). Environmental Risk Assessment and Risk Management Dept.); Goodrich, M.T. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004386. Source: OSTI; NTIS; INIS; GPO Dep.

The finite difference flow and transport simulator VS2DT was benchmark tested against several other codes which solve the same equations (Richards equation for flow and the Advection-Dispersion equation for transport). The benchmark problems investigated transient two-dimensional flow in a heterogeneous soil profile with a localized water source at the ground surface. The VS2DT code performed as well as or better than all other codes when considering mass balance characteristics and computational speed. It was also rated highly relative to the other codes with regard to ease-of-use. Following the benchmark study, the code was verified against two analytical solutions, one for two-dimensional flow and one for two-dimensional transport. These independent verifications show reasonable agreement with the analytical solutions, and complement the one-dimensional verification problems published in the code's original documentation.

6568 (SAND–94-1292) **1993 site environmental report Tonopah Test Range, Tonopah, Nevada.** Culp, T.; Howard, D.; McClellan, Y. Sandia National Labs., Albuquerque, NM (United States). Oct 1994. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004270. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the environmental surveillance activities conducted by Sandia National Laboratories, the US Environmental Protection Agency, and Reynolds Electrical and Engineering Company for the Tonopah Test Range operated by Sandia National Laboratories. Sandia National Laboratories' responsibility for environmental monitoring results extend to those activities performed by Sandia National Laboratories or under its direction. Results from other environmental monitoring activities are included to provide a measure of completeness in reporting. Other environmental compliance programs such as the National Environmental Policy Act of 1969, environmental permits, and environmental restoration and waste management programs are also included in this report, prepared for the US Department of Energy in compliance with DOE Order 5400.1.

6569 (SAND–94-8732C) **Case study on the destruction of organic dyes in supercritical water.** LaJeunesse, C.A.; Rice, S.F. Sandia National Labs., Livermore, CA (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-950241–1: 5. international symposium on chemical oxidation, Nashville, TN (United States), 15-17 Feb 1995). Order Number DE95002482. Source: OSTI; NTIS; GPO Dep.

Organic dyes, which were used in Navy shells to mark ships and structures, need to be disposed of without burning. A study was undertaken to assess the feasibility of using supercritical water oxidation to destroy organic dyes. Experimental destruction efficiencies, product analyses, and process configuration are reported.

6570 (TVA/WM–93/10) **General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition.** Steiner, G.R.; Watson, J.T. Tennessee Valley Authority, Chattanooga, TN (United States). May 1993. 42p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). Order Number DE95003303. Source: OSTI; NTIS.

One of the Tennessee Valley Authority's (TVA's) major goals is cleanup and protection of the waters of the Tennessee River system. Although great strides have been made, point source and nonpoint source pollution still affect the surface water and groundwater quality in the Tennessee Valley and nationally. Causes of this pollution are poorly operating wastewater treatment systems or the lack of them. Practical solutions are needed, and there is great interest and desire to abate water pollution with effective, simple, reliable and affordable wastewater treatment processes. In recognition of this need, TVA began demonstration of the constructed wetlands technology in 1986 as an alternative to conventional, mechanical processes, especially for small communities. Constructed wetlands can be downsized from municipal systems to small systems, such as for schools, camps and even individual homes.

6571 (UCRL-JC–117678) **Innovative technologies for in-situ remediation.** Ragaini, R.; Aines, R.; Knapp, R.; Matthews, S.; Yow, J. Lawrence Livermore National Lab., CA (United States). Jun 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210194–12: International symposium on environmental contamination in Central and Eastern Europe, Budapest (Hungary), 12-16 Oct 1992). Order Number DE94017174. Source: OSTI; NTIS; INIS; GPO Dep.

LLNL is developing several innovative remediation technologies as long-term improvements to the current pump and treat approaches to cleaning up contaminated soils and groundwater. These technologies include dynamic underground stripping, in-situ microbial filters, and remediation using bremsstrahlung radiation. Concentrated underground organic contaminant plumes are one of the most prevalent groundwater contamination sources. The solvent or fuel can percolate deep into the earth, often into water-bearing regions. Collecting as a separate, liquid organic phase called dense non-aqueous-phase liquids (DNAPLs), or light NAPLs (LNAPLs), these contaminants provide a source term that continuously compromises surrounding groundwater. This type of spill is one of the most difficult environmental problems to remediate. Attempts to remove such material requires a huge amount of water which must be washed through the system to clean it, requiring decades. Traditional pump and treat approaches have not been successful. LLNL has developed several innovative technologies to clean up NAPL contamination. Detailed descriptions of these technologies are given.

6572 (AECS-PR-G/FRSR–85) **Natural radioactivity in hot and mineral waters in Syria.** Othman, I. (Atomic Energy Commission, Damascus (Syrian Arab Republic). Dept. of Radiation Protection and Nuclear Safety); Abbass, M.; Kattan, Z. Atomic Energy Commission, Damascus (Syrian Arab Republic). Dept. of Radiation Protection and Nuclear Safety; Atomic Energy Commission, Damascus (Syrian Arab Republic). Dept. of Geology and Nuclear Ores. Aug 1994. 64p. (In Arabic). Order Number DE95610920. Source: OSTI; NTIS (US Sales Only); INIS.

A study of water chemistry and radioactivity of hot and mineral ground waters was conducted in Syria in order to determine the natural radioactivity levels as well as the mobility process of major radionuclides in the studied systems. The water samples were collected generally from carbonate and basaltic aquifer systems. The chemistry of groundwaters was a reflection of the rock type, while no relationship was found between the radionuclide activities and

water temperatures. The increase of ^{222} Rn concentration in hot and mineral waters was accompanied by a similar increase of the concentration of its patent radionuclides (U_{tot} and ^{226} Ra). In parallel, the relative increase of ^{222} Rn concentration was correlated significantly with the presence of the large faults systems prevailing in the studied areas (Palmyrides and Great African Faults Systems). In all the cases, the radionuclide activity levels were below the maximum contaminant levels given for drinking water and health effects. (author). 11 refs., 7 figs., 8 tabs.

6573 (CIEMAT–748) **Lake-0: A model for the simulation of nuclides transfer in lake scenarios.** Garcia-Olivares, A.; Aguero, A.; Pinedo, P. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 92p. Order Number DE95722442. Source: OSTI; NTIS; INIS.

This report presents documentation and a user's manual for the program LAKE-0, a mathematical model of nuclides transfer in lake scenarios. Mathematical equations and physical principles used to develop the code are presented in section 2. The program use is presented in section 3 including input data sets and output data. Section 4 presents two example problems, and some results. The complete program listing including comments is presented in Appendix A. Nuclides are assumed to enter the lake via atmospheric deposition and carried by the water runoff and the dragged sediments from the adjacent catchment. The dynamics of the nuclides inside the lake is based in the model proposed by Codell (11) as modified in (5). The removal of concentration from the lake water is due to outflow from the lake and to the transfer of activity to the bottom sediments. The model has been applied to the Esthwaite Water (54 degree 21 minute N, 03 degree 00 minute W at 65 m. asl.) in the frame of the VAMP Aquatic Working Group (8) and to Devoke Water (54 degree 21 minute 5'N, 03 degree, 18 minute W at 230 m. asl.)

6574 (CIEMAT–752) **DRENA: A model for the transport of nuclides in drainage slopes.** Garcia-Olivares, A.; Aguero, A.; Pinedo, P. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 92p. Order Number DE95730387. Source: OSTI; NTIS; INIS.

This report presents documentation and a user's manual for program DRENA, a mathematical model of nuclides transfer in simple slopes and sections of a drainage catchment. Mathematical equations and physical principles utilized to develop the code are presented in section 2. The flowchart and some mathematic and numerical details are presented in Section 3. Section 4 presents an overview of how problems should be set up to properly use the code as well as the detailed input instructions and output results formats. One example problem, including sample input data sets and output data, are presented in Section 5. The complete program listings including comments are presented in the Appendices. Nuclides are assumed to enter the catchment via atmospheric deposition and then carried by the water runoff and the dragged sediments. The desorption/adsorption dynamics between water and sediments are considered to be in the equilibrium given by a Kd parameter, a distribution coefficient. Codell's and Einstein expressions for the caudal and concentration of dragged sediments are utilized. (Author)

6575 (CRIE-U–93048) **Development of water purification technologies for intensive fish culture. 10. Rearing of Japanese flounder with closed seawater recirculation system equipped with immobilized bacteria.** Uemoto, H.; Watanabe, Y.; Kikuchi, K. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Mar 1994. 22p. (In Japanese). Order Number DE95730181. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

Japanese flounder were reared by a seawater recirculation and filtration system with immobilized bacteria. As a water purification system, used were a nitrification tank and denitrification tank which were both filled with immobilized nitrifying bacteria and denitrifying bacteria, respectively. The flounder could be reared for 180 days with their body weight doubled at the end of experiment. Ammonia exhausted from the flounder was not accumulated in the rearing water. Nitric acid produced by the oxidation of ammonia was prevented from heightening its concentration in the denitrification tank. Usable immediately after having been filled into the filtration tank, both immobilized nitrifying and denitrifying bacteria are stable in activity without being affected by organic matter in the rearing water. The dissolution and disintegration of carrier were not confirmed. The high activity of immobilized nitrifying bacteria and denitrifying bacteria was observed on the surface and in the central part, respectively of the carrier. The activity of both bacteria was confirmed inside the carrier. From the foregoing, the high density rearing was known to be possible even in a filtration tank miniaturized to the size of about 20% of the conventional one. 29 refs., 18 figs., 2 tabs.

6576 (DOE/EH–0426) **Comprehensive baseline environmental audit of former underground test areas in Colorado, Nevada, and New Mexico.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). May 1994. 146p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003291. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the results of the Comprehensive Baseline Environmental Audit of Former Underground Test Areas (FUTAS) in the States of Colorado, Nevada, and New Mexico. DOE and contractor systems for management of environmental protection activities on the Nevada Test Site (NTS) were not within the scope of the audit. The audit was conducted May 16-May 26, 1994, by the Office of Environmental Audit (EH-24). DOE 5482.1 B, "Environment, Safety, and Health Appraisal Program", establishes the mission of EH-24, which is to provide comprehensive, independent oversight of Department-wide environmental programs on behalf of the Secretary of Energy. The ultimate goal of EH-24 is to enhance environmental protection and minimize risk to public health and the environment. EH-24 accomplishes its mission using systematic and periodic evaluations of DOE's environmental programs within line organizations and supplemental activities that strengthen self-assessment and oversight functions within program, field, and contractor organizations. These evaluations function as a vehicle through which the Secretary and program managers are apprised of the status and vulnerabilities of Departmental environmental activities and environmental management systems. Several types of evaluations are conducted, including: (1) comprehensive baseline environmental audits; (2) routine environmental audits; (3) environmental management assessments; and (4) special issue reviews.

6577 (INIS-JP–024, pp. B440/1-B440/10) **New measurement techniques of environmental radioactivity. Methods of surveying marine radioactivity.** Kobayashi, Yoshii (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Industrial Forum, Inc., Tokyo (Japan); Japan Radioisotope Association, Tokyo (Japan); Atomic Energy Society of Japan, Tokyo (Japan). 1994. 596p. (In Japanese). (CONF-940268–: 21. Japan conference on radiation and radioisotopes, Tokyo (Japan), 2-4 Feb 1994). In *Proceedings of the 21st Japan conference on radiation and radioisotopes. The 100th year since the discovery of X-ray, and expectation to the future development.* Order Number DE94785275. Source: OSTI; NTIS; INIS.

Measurements of radioactivity have been carried out in solution or suspension in sea-water, bottom sediments and specific marine organisms. The general approach to radionuclide measurement in seawater and bottom sediments has been concentration by coprecipitation, adsorption, ion exchange or solvent extraction. These methods employed are based primarily on shipboard collection of samples followed by land-based laboratory analyses and are too time-consuming. For rapid measurement, in situ measurement of seawater or seabed gamma-ray has developed. A gamma-ray detecting probe containing the NaI(Tl) scintillation or germanium detector is enclosed in a sealed cylinder. The measurements are made by suspending the probe in a 200-300 liter tank and passing seawater through the tank by means of ship deck pumping system, towing the probe across the seafloor, hanging down the probe to the seabed, or loading the probe on a remotely operated undersea vehicle. In situ measurement of gamma-ray in the marine environment has some application to a mineral exploration and to monitoring of sea areas which may become contaminated as the result of accidents or contamination incidents. This article reviews several gamma-ray detecting probes and describes the recent

studies at JAERI on the development of a small electric-cooled Ge gamma-ray detector and a marine environmental radioactivity investigation system for in situ measurement of gamma-ray. (J.P.N.).

6578 (INIS-mf–14298) **Baseline data compilation on radioactivity levels in drinking water, groundwater, waste water, sewage sludge, residues and wastes, accompanying the 1990 annual report on 'Environmental radioactivity and radiation burden'.** WaBoLu-Hefte, v. 5/1993. Abelmann, S.; Buenger, T.; Ruehle, H.; Viertel, H. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Wasser-, Boden- und Lufthygiene. 1993. 203p. (In German). Order Number DE95733336. Source: OSTI; NTIS (US Sales Only); INIS.

The report summarizes the data measured in 1990 in compliance with the Preventive Radiation Protection Act. The measured values of the environmental monitoring stations established in the vicinity of nuclear installations in compliance with the Directive for Emission Monitoring of Nuclear Installations are given in tables showing the data for groundwater, drinking water, and liquid effluents. (HP)

6579 (INIS-mf–15069) **Filtration and flocculating filtration.** Verfahrensberichte zur Abwasserbehandlung, v. 14. Verband der Chemischen Industrie e.V., Frankfurt am Main (Germany). Ausschuss Wasser und Abwasser. Dec 1992. 29p. Order Number DE95726951. Source: OSTI; NTIS (US Sales Only); INIS.

Filtration of the sewage effluents of secondary sedimentation tanks serves to reduce the concentration of filtrable materials and to remove substances contained or adsorbed therein, e.g., heavy metals, oxygen-depleting substances, nitrogen and phosphorus compounds, and AOX-relevant substances. On the other hand, filtration is not a compensation for insufficient secondary treatment. The filter capacity depends on the types of substances to be filtered. In continuous operation, the upper limit will be about 20-40 mg/l. Higher capacities are possible for short periods of time. For further reduction of phosphates filtration is supplemented by filtration and flocculation (flocculating filtration). (orig./EF)

6580 (TVA/WM–93/13) **Aerial inventory of land uses and nonpoint pollution sources in the Lick Creek Watershed of the Nolichuky River Basin.** Carroll, T.L. Tennessee Valley Authority, Chattanooga, TN (United States). May 1993. 388p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). Order Number DE95003304. Source: OSTI; NTIS.

Low altitude color infrared (CIR) aerial photography to survey and inventory land uses and potential nonpoint sources of pollution which included eroding streambanks, eroding roadbanks, and livestock sites. The survey area encompassed the watersheds of the Lick Creek drainage in the Nolichucky River Basin in Northeast Tennessee. Land use inventories assist stream quality evaluations by characterizing land use and nonpoint pollution sources (NPS) that have the potential to cause offsite stream impacts. Survey results for this study are based on land use conditions during March 1990. The Lick Creek drainage comprises about 164,856 acres. Pastureland is the predominant land use representing 59 percent of the total watershed area, followed by forestland (32 percent), cropland (6 percent), urban land with (2 percent), and disturbed land (<1 percent). Most of the estimated total soil loss for the watershed derives from pastureland (69 percent), followed by cropland (21 percent), disturbed land (7 percent), and forest land (3 percent). Disturbed land has the highest average field soil loss for the watershed, at 161.2 tons/acre/year. Cattle operations are the predominant type of livestock operation in the Lick Creek drainage. Most of these cattle operations are unconfined and not adjacent to streams. Eroding streambanks and roadbanks, in addition to producing sediment in the stream, provide a means for nonpoint source pollution to enter streams without being first filtered, as through a vegetative cover. In the Lick Creek drainage, there are 14.2 miles of eroding streambanks and 2.3 miles of channelized stream segments, out of a total stream length for the watershed of 1,091.7 miles. There are 4.6 miles of livestock access to streams 181.1 miles of probable livestock access to streams, and 169.6 miles of potential livestock access to streams. Finally, there are 56.1 miles of eroding roadbanks, and 311.1 miles of unpaved roads.

6581 (IVL-B–1158) **Study of thermophilic anaerobic cleaning systems.** Boman, B.; Davisson, G. Swedish Environmental Research Inst., Stockholm (Sweden). Nov 1994. 18p. (In Swedish). Order Number DE95723962. Source: OSTI; NTIS.

The aim of this study was to indicate how mesophile and thermophilic anaerobic systems differ in their capacity to degrade persistent organic compounds. The experiments were carried out in semi-batch lab.scale reactors working at 35, 55 and 70 degrees C and were evaluated by recording pH, COD, TSS, redox potential, fatty acids, gas production, methane concentration and the concentration of specific organic compounds. Totally, seven different reactors and four different specific organic compounds were used in this study. The microbial activity within the semi-batch reactors showed a pronounced tendency to oscillate in an irregular and unpredictable way. This behaviour stressed the difficulties in running the decided experiments. These experiences are unfortunately confirmed by many other investigators within the present field. The results do not indicate differences between mesophile and thermophilic anaerobic reactors in terms of 'not degradable-degradable' but only as differences in degree of degradation rates. 6-chlorovanillin and 3,5-dinitrobenzoic acid showed increasing degradation rate in the thermophilic range while no differences could be detected for 4,5-dichloroguaiacol. In the case of β-sitosterol the mesophile reference reactor crash. 14 refs, 6 figs, 3 tabs

6582 (PNL–9987) **Ferruginous hawks on the Yakima Training Center.** Mazaika, R.; Cadwell, L.L. Pacific Northwest Lab., Richland, WA (United States). Jul 1994. 61p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE94017393. Source: OSTI; NTIS; GPO Dep.

Habitat quality for ferruginous hawks (Buteo regalis) is largely determined by availability of nest sites and adequate prey base. A limitation of one of these will limit the number of hawks in an area. In general, ferruginous hawks are adaptable to various nesting substrates and will nest in proximity to other closely related sympatric species (e.g., red-tailed hawk, Swainson's hawk). This analysis focused on an assessment of prey base availability and habitat disturbance in the vicinity of historic nest sites and small mammal trap sites on the Yakima Training Center (YTC) in Washington State. The primary ground-disturbing activities on the YTC are associated with military training, fire, and grazing. In addition to the direct effect these activities can have on ferruginous hawks, indirect effects may result from changes in composition, density, and structure of vegetation that subsequently alter faunal population numbers and species diversity. A summary of results of small mammal trapping, population estimation, vegetative analysis and disturbance rating at seven trap sites during the time period of June through August of 1993 are presented.

6583 (DOE/ER/20019–T1) **Genetic and biophysical studies of the photosynthetic reaction center: Final technical report.** Youvan, D.C. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER20019. Order Number DE95004179. Source: OSTI; NTIS; GPO Dep.

This research is aimed at understanding how critical amino acid residues (and peptides) interact to modify the chemistry of the prosthetic groups, for example: (1) in determining whether bacteriochlorophyll (BC) or bacteriopheophytin (BP) is bound at particular sites, (2) in facilitating electron transfer between prosthetic groups either by direct mechanisms or superexchange, (3) in modifying redox or spectral properties of the prosthetic groups, (4) in imparting

resistance to certain quinone inhibitors, such as the triazine herbicides, and (5) in directing the path of the photoelectron down only one of two apparent pathways in the reaction center. A principal engineering goal of this research is to construct "wrong-way" electron transfer mutants. This will be accomplished either by changing the specificity of tetrapyrrole binding sites (BC <-> BP interconversion) or by "swapping" entire helices through the pseudo C2 symmetry axis. Such mutants are important for understanding pigment-protein assembly as well as mechanistic aspects of photochemistry. This report lists a point-by-point summary of the most important findings in the research over the past 4 years. More time and effort was dedicated to combinatorial mutagenesis on light harvesting antennae than initially proposed. The additional award from DOE for building a Digital Imaging Spectrophotometer (DIS) led to the development of general tools for studying the spectra of mutants directly on petri dishes. Applications of DIS should be even more general, including energy studies in plants and cyanobacteria.

6584 (ORNL/TM–12821) **Correcting sequencing errors in DNA coding regions using a dynamic programming approach.** Xu, Y.; Mural, R.J.; Uberbacher, E.C. Oak Ridge National Lab., TN (United States). Dec 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004223. Source: OSTI; NTIS; GPO Dep.

This paper presents an algorithm for detecting and "correcting" sequencing errors that occur in DNA coding regions. The types of sequencing error addressed include insertions and deletions (indels) of DNA bases. The goal is to provide a capability which makes single-pass or low-redundancy sequence data more informative, reducing the need for high-redundancy sequencing for gene identification and characterization purposes. The algorithm detects sequencing errors by discovering changes in the statistically preferred reading frame within a putative coding region and then inserts a number of "neutral" bases at a perceived reading frame transition point to make the putative exon candidate frame consistent. The authors have implemented the algorithm as a front-end subsystem of the GRAIL DNA sequence analysis system to construct a version which is very error tolerant and also intend to use this as a testbed for further development of sequencing error-correction technology. On a test set consisting of 68 Human DNA sequences with 1% randomly generated indels in coding regions, the algorithm detected and corrected 76% of the indels. The average distance between the position of an indel and the predicted one was 9.4 bases. With this subsystem in place, GRAIL correctly predicted 89% of the coding messages with 10% false message on the "corrected" sequences, compared to 69% correctly predicted coding messages and 11% falsely predicted messages on the "corrupted" sequences using standard GRAIL II method. The method uses a dynamic programming algorithm, and runs in time and space linear to the size of the input sequence.

6585 (DOE/ER/13426–T3) **Structural studies of complex carbohydrates of plant cell walls. Final report, December 15, 1989–June 14, 1993.** Darvill, A.G. Georgia Univ., Athens, GA (United States). Complex Carbohydrate Research Center. Oct 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-85ER13426. Order Number DE95003099. Source: OSTI; NTIS; GPO Dep.

Characterizing the polysaccharides that constitute the primary cell walls of plants and developing the methods for these characterizations has been a major research goal of our laboratory for many years. We have made considerable progress in both of these areas during the past three years. The cell walls of a plant determine the plant's structure and morphology and act as a barrier to pests. Cell walls also control the rate of growth of plant cells and are a source of complex carbohydrates with biological regulatory properties (oligosaccharins). The research projects supported by this grant concentrate on the isolation and structural characterization of the complex carbohydrates that account for approximately 70–80% of the primary cell walls of dicotyledons and non-graminaceous monocotyledons. Abstracts of papers published, in press, or in preparation reporting work supported by this grant during the past three years follow and summarize more fully the progress made in this research project.

6586 (CONF-9411116–) **DOE Human Genome Program: Contractor-Grantee Workshop IV, November 13–17, 1994, Santa Fe, New Mexico.** Oak Ridge National Lab., TN (United States). Oct 1994. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From U.S. Department of Energy (DOE) human genome program contractor-grantee workshop; Santa Fe, NM (United States); 13-17 Nov 1994. Order Number DE95002230. Source: OSTI; NTIS; GPO Dep.

This volume contains the proceedings of the fourth Contractor-Grantee Workshop for the Department of Energy (DOE) Human Genome Program. Of the 204 abstracts in this book, some 200 describe the genome research of DOE-funded grantees and contractors located at the multidisciplinary centers at Lawrence Berkeley Laboratory, Lawrence Livermore National Laboratory, and Los Alamos National Laboratory; other DOE-supported laboratories; and more than 54 universities, research organizations, and companies in the United States and abroad. Included are 16 abstracts from ongoing projects in the Ethical, Legal, and Social Issues (ELSI) component, an area that continues to attract considerable attention from a wide variety of interested parties. Three abstracts summarize work in the new Microbial Genome Initiative launched this year by the Office of Health and Environmental Research (OHER) to provide genome sequence and mapping data on industrially important microorganisms and those that live under extreme conditions. Many of the projects will be discussed at plenary sessions held throughout the workshop, and all are represented in the poster sessions.

6587 (LA-UR–94-3972) **Technologies for large-scale physical mapping of human chromosomes.** Beugelsdijk, T.J. Los Alamos National Lab., NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950257–1: International conference on automation, robotics, and artificial intelligence, Montreaux (Switzerland), 7-10 Feb 1995). Order Number DE95003669. Source: OSTI; NTIS; GPO Dep.

Since its inception 6 years ago, the Human Genome Project has made rapid progress towards its ultimate goal of developing the complete sequence of all human chromosomes. This progress has been made possible through the development of automated devices by laboratories throughout the world that aid the molecular biologist in various phases of the project. The initial phase involves the generation of physical and genetic maps of each chromosome. This task is nearing completion at a low resolution level with several instances of very high detailed maps being developed for isolated chromosomes. In support of the initial mapping thrust of this program, the robotics and automation effort at Los Alamos National Laboratory has developed DNA gridding technologies along with associated database and user interface systems. This paper will discuss these systems in detail and focus on the formalism developed for subsystems which allow for facile system integration.

6588 (LBL–36154) **Genetic and metabolic influences on LDL subclasses.** Krauss, R.M. (Lawrence Berkeley Lab., CA (United States)); Rotter, J.I.; Lusis, A.J. Lawrence Berkeley Lab., CA (United States). Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States);Department of Health and Human Services, Washington, DC (United States);National Dairy Council, Rosemont, IL (United States). DOE Contract AC03-76SF00098. (CONF-9410255–1: 10. international symposium on atherosclerosis, Montreal (Canada), 10-14 Oct 1994). Order Number DE95003432. Source: OSTI; NTIS; GPO Dep.

Genetic and environmental factors influence LDL particle size and density, and expression of an atherogenic lipoprotein phenotype (ALP) characterized by predominance of small, dense LDL particles. Linkage of ALP the LDL receptor locus has been reported previously. Quantitative sib-pair relative-pair linkage methodologies

were used to test for linkage of LDL particle size to candidate loci in 25 large pedigrees with familial coronary artery disease. Linkage to the LDL receptor gene locus was confirmed (p=0.008). Evidence was also obtained for linkage to the genes for apoCIII, cholesteryl ester transfer protein, and manganese superoxide dismutase. The results suggest multiple genetic determinants of LDL particle size that may involve different metabolic mechanisms giving rise to small, dense LDL and increased atherosclerosis risk.

6589 (UCRL-JC–117919) **Statistical and computational challenges in physical mapping.** Nelson, D.O.; Speed, T.P. Lawrence Livermore National Lab., CA (United States). Jun 1994. 11p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9406290–1: 26. symposium on the interface: computer science and statistics, Triangle Park, NC (United States), 15-18 Jun 1994). Order Number DE95003658. Source: OSTI; NTIS; GPO Dep.

One of the great success stories of modern molecular genetics has been the ability of biologists to isolate and characterize the genes responsible for serious inherited diseases like Huntington's disease, cystic fibrosis, and myotonic dystrophy. Instrumental in these efforts has been the construction of so-called "physical maps" of large regions of human chromosomes. Constructing a physical map of a chromosome presents a number of interesting challenges to the computational statistician. In addition to the general ill-posedness of the problem, complications include the size of the data sets, computational complexity, and the pervasiveness of experimental error. The nature of the problem and the presence of many levels of experimental uncertainty make statistical approaches to map construction appealing. Simultaneously, however, the size and combinatorial complexity of the problem make such approaches computationally demanding. In this paper we discuss what physical maps are and describe three different kinds of physical maps, outlining issues which arise in constructing them. In addition, we describe our experience with powerful, interactive statistical computing environments. We found that the ability to create high-level specifications of proposed algorithms which could then be directly executed provided a flexible rapid prototyping facility for developing new statistical models and methods. The ability to check the implementation of an algorithm by comparing its results to that of an executable specification enabled us to rapidly debug both specification and implementation in an environment of changing needs.

6590 (DOE/ER/60561–10) **Advancing PET science for new measures of brain function. Progress report, January 1, 1994–December 31, 1994.** Kuhl, D.E. Michigan Univ., Ann Arbor, MI (United States). Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60561. Order Number DE95004305. Source: OSTI; NTIS; INIS; GPO Dep.

This project has continued the development of new chemistry and imaging physics applicable to PET studies of the human brain. In basic radiochemistry research, the authors have developed a modified approach to solid-phase supported [^{11}C]methylation system, in part dependent on the design, fabrication and validation of new small, sensitive and accurate positron detectors useful in tracking the flow of radioactivity through the synthesis apparatus. Radiopharmaceutical efforts have resulted in synthesis of new tracers of mitochondrial enzymes. For evaluation of new PET radiotracers, the authors have applied new models of unilateral brain lesions using quinolinic acid and MPP+, as models of neurodegenerative diseases. In the physics and data analysis research area the authors have developed faster and more accurate means of performing image reconstruction for use with both emission and transmission data. The authors are optimizing acquisition and kinetic modeling strategies for new radiotracers. The authors also have implemented and proven the utility of performing task switching during PET CBF activation studies for the purpose of enhancing signal-to-noise and greater detectability of areas of activation. The authors also working on routines for standardization of analysis strategies for group vs. group and individual vs. group comparisons.

6591 (JAERI-M–94-019, pp. 104-112) **Atomic, molecule's and nuclear data for medical application.** Iwanami, Shigeru (Kitasato Univ., Sagamihara, Kanagawa (Japan). School of Medicine). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

Medical physicists need atomic and nuclear data. What kinds of data do they need? One answer is 'JARP Medical Physics Data Book'. So we introduce this DATA BOOK as a typical example of atomic, molecule's and nuclear data for medical applications. (author).

6592 (JAERI-M–94-019, pp. 154-157) **Needs of atomic, molecule's and nuclear data for medical application in Japan.** Iwanami, Shigeru (Kitasato Univ., Sagamihara, Kanagawa (Japan). School of Medicine). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

There are large potential needs of atomic and nuclear data for medical applications in Japan. But number of medical physicists who need their data is very small. The status of medical physicist does not formally exist in Japanese hospitals. Then practical needs for atomic and nuclear data are small in Japan. (author).

6593 (LA-UR–94-3978) **Taylor series expansion and modified extended Prony analysis for localization.** Mosher, J.C.; Lewis, P.S. Los Alamos National Lab., NM (United States). [1994]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9410156–3: 28. annual Asilomar conference on signals, systems, and computers, Pacific Grove, CA (United States), 31 Oct - 2 nov 1994). Order Number DE95003671. Source: OSTI; NTIS; GPO Dep.

In the multiple source localization problem, many inverse routines use a rooting of a polynomial to determine the source locations. The authors present a rooting algorithm for locating an unknown number of three-dimensional, near-field, static sources from measurements at an arbitrarily spaced three-dimensional array. Since the sources are near-field and static, the spatial covariance matrix is always rank one, and spatial smoothing approaches are inappropriate due to the spatial diversity. The authors approach the solution through spherical harmonics, essentially replacing the point source function with its Taylor series expansion. They then perform a modified extended Prony analysis of the expansion coefficients to determine the number and location of the sources. The full inverse method is typically ill-conditioned, but a portion of the algorithm is suitable for synthesis analysis. They present a simulation for simplifying point charges limited to a spherical region, using an array of voltage potential measurements made outside the region. Future efforts of this work will focus on adapting the analysis to the electroencephalography and magnetoencephalography.

6594 (LBL–35540) **Electrostatic quadrupole DC accelerators for BNCT applications.** Kwan, J.W.; Anderson, O.A.; Reginato, L.L.; Vella, M.C.; Yu, S.S. Lawrence Berkeley Lab., CA (United States). Apr 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940976–2: 1. International workshop on accelerator-based neutron sources for boron neutron capture therapy, Jackson, WY (United States), 11-14 Sep 1994). Order Number DE95003435. Source: OSTI; NTIS; INIS; GPO Dep.

A dc electrostatic quadrupole (ESQ) accelerator is capable of producing a 2.5 MeV, 100 mA proton beam for the purpose of generating neutrons for Boron Neutron Capture Therapy. The ESQ accelerator is better than the conventional aperture column in high

beam current application due to the presence of stronger transverse field for beam focusing and for suppressing secondary electrons. The major challenge in this type of accelerator is in developing the proper power supply system.

6595 (NUREG/CP–0133-Vol.1, pp. 229-252) **An examination of human factors in external beam radiation therapy: Findings and implications.** Henriksen, K.; Kaye, R.D.; Jones, R.E. Jr.; Morisseau, D.S.; Persensky, J.J. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-931079–Vol.1: 21. water reactor safety information meeting, Bethesda, MD (United States), 25-27 Oct 1993). In *Proceedings of the Twenty-First Water Reactor Safety Information Meeting: Volume 1, Plenary session; Advanced reactor research; advanced control system technology; advanced instrumentation and control hardware; human factors research; probabilistic risk assessment topics; thermal hydraulics; thermal hydraulic research for advanced passive LWRs.* 586p. Source: OSTI; NTIS; INIS; GPO.

To better understand the contributing factors to human error in external beam radiation therapy, the US Nuclear Regulatory Commission has undertaken a series of human factors evaluations. A team of human factors specialists, assisted by a panel of radiation oncologists, medical physicists, and radiation technologists, conducted visits to 24 radiation oncology departments at community hospitals, university centers, and free-standing clinics. A function and task analysis was initially performed to guide subsequent evaluations in the areas of human-system interfaces, procedures, training and qualifications, and organizational policies and practices. Representative findings and implications for improvement are discussed within the context of a dynamic model which holds that misadministration likely results from the unanticipated interaction of several necessary but singly insufficient conditions.

6596 (NUREG/CP–0133-Vol.1, pp. 253-272) **Human error in remote Afterloading Brachytherapy.** Quinn, M.L. (Pacific Science and Engineering Group Inc., San Diego, CA (United States)); Callan, J.; Schoenfeld, I.; Serig, D. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research; Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-931079–Vol.1: 21. water reactor safety information meeting, Bethesda, MD (United States), 25-27 Oct 1993). In *Proceedings of the Twenty-First Water Reactor Safety Information Meeting: Volume 1, Plenary session; Advanced reactor research; advanced control system technology; advanced instrumentation and control hardware; human factors research; probabilistic risk assessment topics; thermal hydraulics; thermal hydraulic research for advanced passive LWRs.* 586p. Source: OSTI; NTIS; INIS; GPO.

Remote Afterloading Brachytherapy (RAB) is a medical process used in the treatment of cancer. RAB uses a computer-controlled device to remotely insert and remove radioactive sources close to a target (or tumor) in the body. Some RAB problems affecting the radiation dose to the patient have been reported and attributed to human error. To determine the root cause of human error in the RAB system, a human factors team visited 23 RAB treatment sites in the US. The team observed RAB treatment planning and delivery, interviewed RAB personnel, and performed walk-throughs, during which staff demonstrated the procedures and practices used in performing RAB tasks. Factors leading to human error in the RAB system were identified. The impact of those factors on the performance of RAB was then evaluated and prioritized in terms of safety significance. Finally, the project identified and evaluated alternative approaches for resolving the safety significant problems related to human error.

6597 (SAND–94-2707C) **Application of HTS technology to cardiac dysrhythmia detection.** Sobel, A.L. (Sandia National Labs., Albuquerque, NM (United States)); Avrin, W.F. Sandia National Labs., Albuquerque, NM (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941119–1: 16. annual international conference of the Engineering in Medicine and Biology Society, Baltimore, MD (United States), 3-6 Nov 1994). Order Number DE95003359. Source: OSTI; NTIS; GPO Dep.

This paper discusses the conceptual design considerations and challenges for development of a contactless, mobile, single channel biomagnetic sensor system based on High-Temperature Superconductor (HTS) Superconducting Quantum Interference Devices (SQUIDs) and employing the Three-SQUID Gradiometer (TSG) concept. Operating in magnetically unshielded environments, as are encountered in many medical scenarios, this instrument class would monitor cardiac electrical activity with minimal patient preparation and intrusiveness, and would notionally be coupled with a clinically adaptive human-system interface (HSI).

6598 (INIS-mf–14404) **CICTAMEX Memory 1991.** Centro de Investigaciones Cientificas y Tecnologicas del Aguacate en el Estado de Mexico (CICTAMEX), Coatepec Harinas (Mexico). 1991. 202p. (In Spanish). Order Number DE95609880. Source: OSTI; NTIS (US Sales Only); INIS.

The avocado agriculture industry at National and International levels is confronted to low yields which are due among other aspects to the high costs of products originated by the height of the tree as well as its foliage which difficults the harvest, low cultural customs of the harvesters and to the overrating of the phyto sanitary control. This has been originated by the actual research trends over avocado at all world level since the research has been oriented to the obtention of dwarf tree varieties with the advantages that this offers. The Salvador Sanchez Colin CICTAMEX Foundation is developing a genetic improvement program with the support of the Instituto Nacional de Investigaciones Nucleares (ININ) by means of the pacific uses of nuclear energy on fruits principally the avocado.

6600 (SAND–94-2149C) **The use of electron beams for pasteurization of meats.** Prestwich, K.R.; Kaye, R.J.; Turman, B.N.; Neau, E.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9409266–1: 1994 American meat industry research conference, San Francisco, CA (United States), 29 Sep - 1 oct 1994). Order Number DE95003352. Source: OSTI; NTIS; INIS; GPO Dep.

Electron beam accelerators can be used for electronic pasteurization of meat products by: (1) using the electrons directly impacting the products, or (2) optimizing the conversion of electron energy to x-rays and treating the product with these x-rays. The choice of process depends on the configuration of the product when it is treated. For electron treatment, ten million electron volt (MeV) kinetic energy is the maximum allowed by international agreement. The depth of penetration of electrons with that energy into a product with density of meat is about five centimeters (cm). Two-sided treatment can be done on products up to 10 cm thick with a two-to-one ratio between minimum and maximum dose.

Ground beef patties are about 1.25 cm (0.5 inch thick). Beams with 2.5 MeV electron energy could be used to treat these products. Our calculations show that maximum to minimum dose ratios less than 1.2 can be achieved with this energy if the transverse beam energy is small. If the product thickness is greater than 10 cm, x-rays can provide the needed dose uniformity. Uniform doses can be supplied for pallets with dimensions greater than 1.2 m on each side using x-rays from a 5 MeV electron beam. The efficiency of converting the electron beam to x-rays and configurations to achieve dose uniformity are discussed.

6601 (CIEMAT–747) **Modeling the systemic retention of beryllium in rat. Extrapolation to human.** Montero Prieto, M.; Vidania Muoz, R. de. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 36p. (In Spanish). Order Number DE95722441. Source: OSTI; NTIS; INIS.

In this work, we analyzed different approaches, assayed in order to numerically describe the systemic behaviour of Beryllium. The experimental results used in this work, were previously obtained by Furchner et al. (1973), using Sprague-Dawley rats, and other animal species. Furchner's work includes the obtained model for whole body retention in rats but not for each target organ. In this work we present the results obtained by modeling the kinetic behaviour of Beryllium in several target organs. The results of this kind of models were used in order to establish correlations among the estimated kinetic constants. The parameters of the model were extrapolated to humans and, finally, compared with other previously published.

6602 (CONF-9304128–) **1993 Radiation Protection Workshop: Proceedings.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. 431p. Sponsored by USDOE, Washington, DC (United States). From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The 1993 DOE Radiation Protection Workshop was conducted from April 13 through 15, 1993 in Las Vegas, Nevada. Over 400 Department of Energy Headquarters and Field personnel and contractors from the DOE radiological protection community attended the Workshop. Forty-nine papers were presented in eleven separate sessions: Radiological Control Manual Implementation, New Approaches to Instrumentation and Calibration, Radiological Training Programs and Initiatives, External Dosimetry, Internal Dosimetry, Radiation Exposure Reporting and Recordkeeping, Air Sampling and Monitoring Issues, Decontamination and Decommissioning of Sites, Contamination Monitoring and Control, ALARA/ Radiological Engineering, and Current and Future Health Physics Research. Individual papers are indexed separately on the database.

6603 (DOE-HDBK–1079-94) **Primer on tritium safe handling practices.** USDOE, Washington, DC (United States). Dec 1994. 38p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003577. Source: OSTI; NTIS; GPO Dep.

This Primer is designed for use by operations and maintenance personnel to improve their knowledge of tritium safe handling practices. It is applicable to many job classifications and can be used as a reference for classroom work or for self-study. It is presented in general terms for use throughout the DOE Complex. After reading it, one should be able to: describe methods of measuring airborne tritium concentration; list types of protective clothing effective against tritium uptake from surface and airborne contamination; name two methods of reducing the body dose after a tritium uptake; describe the most common method for determining amount of tritium uptake in the body; describe steps to take following an accidental release of airborne tritium; describe the damage to metals that results from absorption of tritium; explain how washing hands or showering in cold water helps reduce tritium uptake; and describe how tritium exchanges with normal hydrogen in water and hydrocarbons.

6604 (DOE/NV–374) **Development of the town data base: Estimates of exposure rates and times of fallout arrival near the Nevada Test Site.** Thompson, C.B. (Univ. and Community College System of Nevada, Las Vegas, NV (United States)); McArthur, R.D.; Hutchinson, S.W. Nevada Univ., Reno, NV (United States). Desert Research Inst. Sep 1994. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-85NV10384 ; AC08-90NV10845. Order Number DE95004398. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the U.S. Department of Energy's Off-Site Radiation Exposure Review Project, the time of fallout arrival and the H+12 exposure rate were estimated for populated locations in Arizona, California, Nevada, and Utah that were affected by fallout from one or more nuclear tests at the Nevada Test Site. Estimates of exposure rate were derived from measured values recorded before and after each test by fallout monitors in the field. The estimate for a given location was obtained by retrieving from a data base all measurements made in the vicinity, decay-correcting them to H+12, and calculating an average. Estimates were also derived from maps produced after most events that show isopleths of exposure rate and time of fallout arrival. Both sets of isopleths on these maps were digitized, and kriging was used to interpolate values at the nodes of a 10-km grid covering the pattern. The values at any location within the grid were then estimated from the values at the surrounding grid nodes. Estimates of dispersion (standard deviation) were also calculated. The Town Data Base contains the estimates for all combinations of location and nuclear event for which the estimated mean H+12 exposure rate was greater than three times background. A listing of the data base is included as an appendix. The information was used by other project task groups to estimate the radiation dose that off-site populations and individuals may have received as a result of exposure to fallout from Nevada nuclear tests.

6605 (EPA–520/1-87-023) **An analysis of evacuation options for nuclear accidents.** Tawil, J.J. (Battelle Memorial Inst., Richland, WA (United States)); Strenge, D.L.; Schultz, R.W. Environmental Protection Agency, Washington, DC (United States); Battelle Memorial Inst., Richland, WA (United States). Nov 1987. 246p. Sponsored by Environmental Protection Agency, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005270. Source: OSTI; NTIS; GPO Dep.

In this report we consider the threat posed by the accidental release of radionuclides from a nuclear power plant. The objective is to establish relationships between radiation dose and the cost of evacuation under a wide variety of conditions. The dose can almost always be reduced by evacuating the population from a larger area. However, extending the evacuation zone outward will cause evacuation costs to increase. The purpose of this analysis was to provide the Environmental Protection Agency (EPA) a data base for evaluating whether implementation costs and risks averted could be used to justify evacuation at lower doses. The procedures used and results of these analyses are being made available as background information for use by others. We develop cost/dose relationships for 54 scenarios that are based upon the severity of the reactor accident, meteorological conditions during the release of radionuclides into the environment, and the angular width of the evacuation zone. The 54 scenarios are derived from combinations of three accident severity levels, six meteorological conditions and evacuation zone widths of 70°, 90°, and 180°.

6606 (INP–1558/AP) **Radiological hazard from coal-fired power plants in Poland.** Nowina-Konopka, M. (Institute of Nuclear Physics, Cracow (Poland)). Institute of Nuclear Physics, Cracow (Poland). 1991. 31p. (In Polish). Order Number DE95610948. Source: OSTI; NTIS; INIS.

The radiobiological hazard of Polish population due to coal combustion for electric power production was assessed. Activity concentrations of the elementary radionuclides in coal and all kinds of ashes were measured. The ATMO computer program was applied to calculate the annual increase of the activity concentration in the air and of the annual increase of activity falling on the ground. Exposition by inhalation, oral ingestion and external irradiation was taken into account. The assessed value of irradiation was taken into account. The assessed value of individual effective dose equivalent commitments for the critical group is 0.1 mSv, i.e. 4% of the total dose rate from natural radiation. The collective effective dose equivalent commitments received of all sources by an inhabitant of Poland as a consequence of annual coal combustion in Polish CPP is 367 manSv/a (i.e. 47 manSv per GWa), i.e. 0.4% of the dose from natural radiation. (author). 11 refs, 3 figs, 8 tabs.

6607 (LUNBDS-NBFB–1028/1-88(1994)) **Effects of ultraviolet radiation on microtubule organisation and morphogenesis in plants.** Staxen, I. Lund Univ. (Sweden). Dept. of Plant Physiology. Sep 1994. 44p. Order Number DE95609825. Source: OSTI; NTIS; INIS.

The involvement of the cytoskeleton in the development of somatic embryos was studied in Larix x eurolepis. Protoplasts were isolated from both somatic embryo-regenerating and non-generating cultures and fractionated on a discontinuous Percoll density gradient. Protoplasts of two cell lines of Larix eurolepis, one with regenerating potential and one lacking this potential, were compared. In contrast to the non-regenerating line were a protoplast-like organisation of the cortical microtubules was maintained, re-organisation of this microtubular network occurred in the regenerable line after only three days of culture, indicating that organised growth was occurring. However, this early organisation of cortical microtubules may not always be a valid marker for regenerable and non-regenerable material. In order to investigate the effect of ultraviolet-B (UV-B, 280-320 nm) radiation on the microtubule cytoskeleton, protoplasts were isolated from leaves of Petunia hybrida and subjected to four different doses of UV-B radiation. The organisation of the microtubules and the progression of the cells through the cell cycle was observed at 0, 24, 48 and 72 h after irradiation. UV-B induced breaks in the cortical microtubules resulting in shorter fragments with increasing amounts of radiation. Also, the division of the protoplasts was delayed. Whole Petunia plants were grown in growth chambers in the presence and absence of UV-B. The plants responded to UV-B with increased rates of CO_2 assimilation, a 60% increase in UV-screening compounds and the changes in the morphology of the leaves that were reflected in a 70-100% increase in leaf area and 20% decrease in leaf thickness. The microtubules of the epidermal cells was not affected by UV-B, nor was the number of epidermal cells (per unit area). The increase in leaf area in the UV-treated plants appeared due to stimulation of cell division in the leaf meristems. 111 refs, 5 figs, 2 tabs.

6608 (NAHRES–15) **Application of stable isotope tracer methods to studies of amino acid, protein, and energy metabolism in malnourished populations of developing countries. Report of an IAEA consultants' meeting held in Vienna, Austria, 14-16 December 1992.** International Atomic Energy Agency, Vienna (Austria). Section of Nutritional and Health-Related Environmental Studies. 1993. 31p. (CONF-9212129–: IAEA consultants' meeting on the application of stable isotope tracer methods to studies of amino acid, protein, and energy metabolism in malnourished populations of developing countries, Vienna (Austria), 14-16 Dec 1992). Order Number DE95609870. Source: OSTI; NTIS (US Sales Only); INIS.

A Consultants' Meeting convened by the IAEA in December 1992, made recommendations on the organization of a Co-ordinated Research Programme (CRP) using stable isotopic techniques for international comparative studies of amino acid, protein, and energy metabolism in chronically undernourished people. The CRP will use recent developments in stable isotope tracer techniques (^{13}C and ^{15}N) to assess the impact of infection in undernourished people on the kinetics of protein breakdown, protein synthesis, amino acid metabolism, and on the synthetic rates of selected plasma proteins. Studies will be conducted in developing countries, particularly in young children. The programme goals are to (i) elaborate methods and model protocols which can be implemented in developing countries to investigate the impact on protein metabolism of infection superimposed on chronic undernutrition; (ii) test they hypothesis that dietary requirements for protein and amino acids are related to the place of nutrition and are altered substantially when infection is superimposed on chronic undernutrition. When feasible, the primary focus on protein/amino acid metabolism will be extended to assessments of protein/energy interactions when $H_2{}^{18}O$ becomes more readily available and/or at research sites with indirect calorimetry equipment. The data generated should be appropriate as a basis for reevaluating amino acid/protein requirements in these populations. Refs.

6609 (NEI-NO–440) **International harmonization of intervention levels.** Jensen, P.H. (Risoe National Lab., Roskilde (Denmark)). No corporate text available. May 1994. 14p. (CONF-9405256–: Nordic seminar on emergency preparedness in nuclear accidents, Oslo (Norway), 4-6 May 1994). Order Number DE95609903. Source: OSTI; NTIS (US Sales Only); INIS.

A summary is given on international guidance on intervention levels in circumstances in which remedial actions might be considered in nuclear accident situations. The nature and limitations of international work and their effect on the resulting guidance are discussed. The basic international principles recommended can be expressed in the following compressed form: (1) serious deterministic effects should be avoided by intervention, (2) each protective measure should be justified, i.e. do more good than harm, (3) the level at which the protective measures are to be introduced should be optimized, i.e. do most good, and (4) each protective measure should be optimized separately and independent of all other countermeasures. It is of great importance that decision makers inform the public of all aspects of their decisions in order to make the decisions transparent, especially when the interventions chosen are mainly for political or social reason rather than health protection grounds. Otherwise the public may be misled and the radiological protection community will be mistrusted. 17 refs., 6 tabs.

6610 (NEI-NO–441) **Intervention principles and levels in the event of a nuclear accident. Final report on the Nordic Nuclear Safety Research Project BER-3.** Walmod-Larsen, O. (Risoe National Lab., Roskilde (Denmark)). No corporate text available. Apr 1994. 8p. (CONF-9405256–: Nordic seminar on emergency preparedness in nuclear accidents, Oslo (Norway), 4-6 May 1994). Order Number DE95609904. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the Nordic BER-3 project has been to harmonize the Nordic intervention levels after a nuclear accident. The paper deals with the findings and recommendations to be presented to the Nordic authorities as background material for common decisions on the most likely protective actions. In the report sheltering, evaluation and relocation are treated in detail. Iodine prophylaxis and foodstuff restrictions are briefly commented on. The basis for this work is the internationally accepted basic principles for interventions.

6611 (NEI-NO–443) **Nordic nuclear emergency exercises. Final report of the BER-5 project.** Bennerstedt, T. (NKS, Roskilde (Denmark)); Stranden, E.; Salo, A. No corporate text available. May 1994. 6p. (CONF-9405256–: Nordic seminar on emergency preparedness in nuclear accidents, Oslo (Norway), 4-6 May 1994). Order Number DE95609905. Source: OSTI; NTIS (US Sales Only); INIS.

In all Nordic countries, nuclear emergency provisions have been revised following the Chernobyl accident. Local and national exercises are carried out regularly in each of the countries. Several actions have been taken to harmonize the approaches of individual Nordic countries. In order to further promote similar decision making procedures in an emergency situation, two Nordic exercises were conducted in 1993. It was important to see if all five countries (Denmark, Finland, Iceland, Norway and Sweden) responded in a similar way to a given situation, as far as risk assessment and countermeasures were concerned. The exercises were mainly aimed at decision makers and advisers of the five national emergency organizations. Thus, the exercises did not include comparison of underlying calculations on, e.g., atmospheric trajectories or transfer of radioactive material from air to ground. Such functions were tested separately in drills that formed part of the overall

Nordic emergency preparedness program. It turned out that considerable effort is required to prepare exercises of this kind and magnitude. In each country, a national exercise leader was appointed. A Nordic evaluation team was set up. Common rules for the simulated inputs during the exercise and for the evaluators were decided on. The scenarios were prepared by an independent group. An essential planning item is the coordination of the Nordic exercises with those performed on a more routine basis in each country. The exercises included an acute-phase situation (NORA), and a late-phase situation (ODIN).

6612 (NIRS-M–97) **Human · mouse genome analysis and radiation biology. Proceedings.** Hori, Tada-aki (ed.). National Inst. of Radiological Sciences, Chiba (Japan). Mar 1994. 288p. (In Japanese, English). (CONF-9311277–: 25. NIRS symposium, Chiba (Japan), 18-19 Nov 1993). Order Number DE95737283. Source: OSTI; NTIS; INIS.

This issue is the collection of the papers presented at the 25th NIRS symposium on Human, Mouse Genome Analysis and Radiation Biology. The 14 of the presented papers are indexed individually. (J.P.N.).

6613 (NUREG–0090-Vol.17-No.2) **Report to Congress on abnormal occurrences, April–June 1994: Volume 17, Number 2.** Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data. Oct 1994. 30p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

Section 208 of the Energy Reorganization Act of 1974 identifies an abnormal occurrence (AO) as an unscheduled incident or event that the Nuclear Regulatory Commission determines to be significant from the standpoint of public health or safety and requires a quarterly report of such events to be made to Congress. This report provides a description of those events that have been determined to be abnormal occurrences during the period of April 1 through June 30, 1994. This report addresses seven abnormal occurrences (AOs) at NRC-licensed facilities. Five involved medical brachytherapy misadministrations, one involved a medical teletherapy misadministration, and one involved a medical sodium iodide misadministration. Four AOs were reported by the Agreement States as of August 3, 1994. Two involved medical brachytherapy misadministrations, one involved a radiation burn received by an industrial radiographer, and one involved a lost well logging source. The report also contains updates of seven AOs previously reported by NRC licensees and five AOs previously reported by Agreement State licensees. Three "Other Events of Interest" are also reported. One involved a deliberate cover up of an error in a diagnostic radiopharmaceutical administration at an NRC licensee, one involved an Order Suspending License and Demand for Information at an NRC licensee, and one involved an overexposure of an industrial radiographer at an Agreement State licensee.

6614 (NUREG–0940-Vol.13-No.3-Pt.2) **Enforcement actions: Significant actions resolved, medical licensees. Quarterly progress report, July–September 1994: Volume 13, Number 3, Part 2.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. Dec 1994. 311p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (July–September 1994) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to medical licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

6615 (PNL-SA–24011) **Estimates of bias and uncertainty in recorded external dose.** Fix, J.J.; Gilbert, E.S.; Baumgartner, W.V. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941017–4: 4. conference on radiation protection and dosimetry, Orlando, FL (United States), 24-27 Oct 1994). Order Number DE95003134. Source: OSTI; NTIS; INIS; GPO Dep.

A study is underway to develop an approach to quantify bias and uncertainty in recorded dose estimates for workers at the Hanford Site based on personnel dosimeter results. This paper focuses on selected experimental studies conducted to better define response characteristics of Hanford dosimeters. The study is more extensive than the experimental studies presented in this paper and includes detailed consideration and evaluation of other sources of bias and uncertainty. Hanford worker dose estimates are used in epidemiologic studies of nuclear workers. A major objective of these studies is to provide a direct assessment of the carcinogenic risk of exposure to ionizing radiation at low doses and dose rates. Considerations of bias and uncertainty in the recorded dose estimates are important in the conduct of this work. The method developed for use with Hanford workers can be considered an elaboration of the approach used to quantify bias and uncertainty in estimated doses for personnel exposed to radiation as a result of atmospheric testing of nuclear weapons between 1945 and 1962. This approach was first developed by a National Research Council (NRC) committee examining uncertainty in recorded film badge doses during atmospheric tests (NRC 1989). It involved quantifying both bias and uncertainty from three sources (i.e., laboratory, radiological, and environmental) and then combining them to obtain an overall assessment. Sources of uncertainty have been evaluated for each of three specific Hanford dosimetry systems (i.e., the Hanford two-element film dosimeter, 1944-1956; the Hanford multi-element film dosimeter, 1957-1971; and the Hanford multi-element TLD, 1972-1993) used to estimate personnel dose throughout the history of Hanford operations. Laboratory, radiological, and environmental sources of bias and uncertainty have been estimated based on historical documentation and, for angular response, on selected laboratory measurements.

6616 (RPII–94/4) **Code of practice for radiological protection in dentistry.** Radiological Protection Inst. of Ireland (Ireland). Nov 1994. 17p. Order Number DE95610983. Source: OSTI; NTIS (US Sales Only); INIS.

This code of practice deals with the use of x-rays in dentistry. It replaces a code published by the Department of Health in 1988. 1 ref., 2 tabs.

6617 (STUK/ST-GUIDE–4.2) **Radiation meters for civil defence.** Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1994. 14p. Translation. The original text in Finnish which is published under the same guide number. The guide is valid from 1 January 1992 and will remain in force until further notice. It replaces the SS guide 5.2 issued on 30 May 1986. Order Number DE95610991. Source: OSTI; NTIS; INIS.

The technical requirements for the radiation meters used in civil defence are specified in the guide. The aim of the requirements is to quarantee sufficient measurement accuracy and reliable operation even in extreme environmental conditions. The guide is based on the following standards: (1) IEC 846 'Beta, X and gamma radiation dose equivalent and dose equivalent rate meters for use in radiation protection', (2) IEC 1017-1 'Portable, transportable of installed X or gamma radiation ratemeters for environmental monitoring, part 1: Ratemeters', and (3) IEC 45 B (Secretariat) 104 'Direct reading, personnel dose equivalent and/or dose equivalent rate monitors for X, gamma and high energy beta radiation'. (12 refs., 5 tabs.).

6618 (STUK/ST-GUIDE–12.2) **The radioactivity of construction materials, fuel peat and peat ash.** Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1994. 7p. Translation of the original text in Finnish which is published under the same guide number. The guide is valid from 1 January 1992 and will remain in force until further notice. It replaces the SS guide 5.2 issued on 30 May 1986. Order Number DE95610990. Source: OSTI; NTIS; INIS.

The guide presents safety requirements related to radiation exposure from building materials and materials used in road and related construction. It also covers the safety requirements for the production of fuel peat and the handling and disposal of peat ash. Guidelines are also given for maintaining the required safety level. (5 refs.).

6619 (UCRL-CR–116511-94-3) **Use of international data sets to evaluate and validate pathway assessment models applicable to exposure and dose reconstruction at DOE facilities. Progress report, March–May 1994.** Anspaugh, L.R. (Lawrence Livermore National Lab., CA (United States)); Hendrickson, S.M. (eds.); Hoffman, F.O. Lawrence Livermore National Lab., CA (United States); Senes Oak Ridge, Inc., TN (United States). Center for Risk Analysis. 1 Jun 1994. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE94017511. Source: OSTI; NTIS; GPO Dep.

The project described in this report was the result of a Memorandum of Cooperation between the US and the former-USSR following the accident at the Chernobyl Nuclear Power Plant Unit 4. A joint program was established to improve the safety of nuclear power plants and to understand the implications of environmental releases. The task of Working Group 7 was "to develop jointly methods to project rapidly the health effects of any future nuclear reactor accident." The current objective of this project is to evaluate and validate pathway-assessment models applicable to exposure and dose reconstruction at DOE facilities through use of international data sets. This project incorporates data used for the prediction of radionuclide transfer through agricultural and aquatic systems to humans. It also includes participation in two multinational studies, BIOMOVS (Biospheric Model Validation Study) with the Swedish National Institute for Radiation Protection and VAMP (Validation of Model Predictions) with the International Atomic Energy Agency, that address testing the performance of models of radionuclide transport through foodchains. In the future, this project will be considered separately from the Chernobyl Studies Project and the essential activities of former Task 7.1D will be folded within the broader umbrella of the BIOMOVS and VAMP projects. The Working Group Leader of Task 7.1D will continue to provide oversight for this project.

6620 (WSRC-MS–94-0404) **Exposure reductions encouraged by the determination of the effective dose equivalent for non-uniform exposures.** Matheny, M.D.; Brown, C.G.; Dyer, S.G. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-941017–1: 4. conference on radiation protection and dosimetry, Orlando, FL (United States), 24-27 Oct 1994). Order Number DE94016962. Source: OSTI; NTIS; INIS; GPO Dep.

DOE Order 5480.11 requires calculation of the effective dose equivalent (EDE) due to non-uniform radiation fields using ICRP-26 weighting factors. To comply with this requirement, Westinghouse Savannah River Company (WSRC) developed a simple dose calculation scheme based on a draft report by the External Dosimetry Working Group of the Health Physics Society Standards Committee. The calculations involved are fairly simple and provide a conservative dose estimate. The resulting EDE estimate provides a much better representation of the risk to the monitored individual than the more prevalent practice of assigning the highest measured dose. Details of the dose assessment methodology are included as an attachment.

The 1990 Clean Air Act Amendments mandated the use of oxygenated gasoline during the winter months, beginning November 1, 1992, in areas of the United States that did not attain the carbon monoxide health standards. Methyl tertiary butyl ether (MTBE) at about 15% by volume was the predominant oxygenate used to meet this mandate. Individuals in a few areas of the country reported health symptoms (e.g., headaches, eye irritation, nose irritation) they they associated with MTBE oxyfuel use. These reports prompted a large, rapid-response research program to investigate certain issues related to the potential health risks of MTBE. All of the available health effects and exposure data were assessed by the Office of Research and Development of the U.S. Environmental Protection Agency. This paper briefly describes the results of that assessment, focusing on the potential for acute exposure risks, chronic noncancer risks, and chronic cancer risks.

6622 (DOE/EV/10449–T2) **Toxic organic compounds from energy production: Final report.** Hites, R.A. Indiana Univ. Foundation, Bloomington, IN (United States). Aug 1988. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract Contract AC02-80EV10449. Source: OSTI; NTIS.

3.

The DOE's Office of Health and Environmental Research has supported a program in Professor Hites' laboratory since 1977. The theme of this program has been identifying potentially toxic organic compounds associated with various combustion effluents, following the fates of these compounds in the environment, and improving the analytical methodology for making these measurements. We have focused on groups of compounds known to be toxic and known to be associated with energy production. These include the polyhalogenated dioxins which are produced by the combustion of refuse derived fuel and polycyclic aromatic hydrocarbons which are produced by the combustion of almost anything. Our study of the fates of these compounds has lead us into photochemistry and indoor air pollution. 7 refs., 12 figs., 2 tabs.

6623 (ETDE/DE-mf–95726859) **Environmental impact and health. Research on risk assessment of environmental substances and other environmental factors for human health.** Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Referat fuer Presse und Oeffentlichkeitsarbeit. Mar 1994. 112p. (In German). Order Number DE95726859. Source: OSTI; NTIS (US Sales Only).

The health of the human being depends essentially on the fact whether it can be managed to form the environment in a way that the strains are reduced to an agreeable extent. The knowledge of material strains as well as the effect of environmental substances on the human being is the prerequisite. An essential goal of this promotion concept is to recognize noxious environmental impacts early to estimate risks for health and to elaborate contributions for avoiding potential noxious environmental impacts. The promotion concept is part of a primary programme 'environmental research and environmental technology' and supplements the programme 'health research in 2000'. In the first part, the reasons and effects of environmental impacts on the human being are described. After a balance of a previous project promotion, research goals, research facilities and working priorities are presented. In the appendix, BMFT promotion measures are introduced related to the subject. (UHE)

6624 (ETDE/DE-mf–95726879) **Terrestrial investigation of forest damages. Tasks, methods and importance.** Bundesministerium fuer Ernaehrung, Landwirtschaft und Forsten, Bonn (Germany). Oct 1993. 32p. (In German). Order Number DE95726879. Source: OSTI; NTIS (US Sales Only).

In the past, the critical situation in the forests could be recognized and present covering the area by means of a terrestrial inquiry of forest damage. Therefore its is a indispensible part of a complex environmental control in the future. Important impulses for the stepwise establishment of a research regarding forest damage started from the inquiry of forest damage. This brochure describes tasks, methods and the status of this inquiry, where the assessment of the state of the top is deatl with the detail in words and pictures. The addresses of the major forestry offices are listed. (UHE)

6625 (ETDE/DE-mf–95726966) **Influence of controlled soil acidification and compensatory liming in the 'Hoeglwald' on the nitrogen and carbohydrate metabolism of very fine roots of spruces. Final report.** Rothe, G.M. Mainz Univ. (Germany). Inst. fuer Allgemeine Botanik. 1991. 45p. (In German). Sponsored

by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0339175H. Order Number DE95726966. Source: OSTI; NTIS (US Sales Only).

The influence of soil acidification on the carbon and nitrogen metabolism of very fine roots of spruces is investigated. All in all, the following changes in the carbohydrate metabolism of roots were observed under soil acidification and compensatory liming: Increased precipitation (neutral overhead irrigation of soil) entails a slight increase in the concentration of fructose in the root cells (+22%), while the concentration of fungal mannite decreases (-30%); exclusive liming so far had no effect worth mentioning on the investigated enzymes and metabolites. By contrast, liming with subsequent neutral overhead irrigation resulted in marked growth of roots (+44%) and increased levels of fructose (+49%) and trehalose (+35%). Compensatory liming reduced the activity of pyruvate kinase by 30%; that of mannite-1-phosphate-dehydrogenase was increased by 39% and that of NADP-mannite-dehydrogenase was reduced by 59%. The concentrations of glucose, fructose, mannite and trehalose are apparently not affected by this. (orig./UWA)

6626 (ETDE/DE-mf–95726996) **Noble metal emissions. Interim report.** Oekologische Forschung. Ende, I. (comp.). Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen (GSF), Neuherberg (Germany). Projekttraeger Umwelt- und Klimaforschung; Forschungszentrum Juelich GmbH (Germany). Projektleitung Biologie, Oekologie, Energie. 1990. 45p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Order Number DE95726996. Source: OSTI; NTIS (US Sales Only).

Common three-way catalytic converters for the reduction of pollutant emission of motor vehicles contain platinum and rhodium as catalysts. This study goes above all into the question if under normal operating conditions platinum is emitted by mechanical abrasion or if gaseous platinum compounds are emitted with the exhaust gas. An analysis method for noble metals has to be developed which is so sensitive that the low concentrations which have an impact on the environment can be recorded. Studies on the toxic and allergic effect of noble metals have until now not been taken up within the scope of this joint research project. In the presented articles on this subject scientists of this field try based on international knowledge a first evaluation of the potential risk of 'platinum'. (orig./VT)

6627 (ETDE/DE-mf–95733464) **Influence of air pollutants and other factors of stress on phytohormone concentrations in trees. Final report. Pt. 2.** Hock, B.; Schneider, P.; Horn, K. Technische Univ. Muenchen (Germany). Lehrstuhl fuer Botanik. Apr 1990. 105p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). Contract BStLU 6495-953-25928. Order Number DE95733464. Source: OSTI; NTIS (US Sales Only).

In the framework of research described in this publication, a method for gibberellin extraction from spruce needles and an enzyme immunoassay for quantitative determination of the gibberellins GA_3 und GA_1 in the trace range were developed. HPLC permitted far-reaching clean-up of the extracts to be analyzed for the subsequent enzyme immunoassay. In addition, the separation of the gibberellins GA_3 and GA_1 was achieved. Needle analyses during exposure chamber experiments at GSF-Neuherberg revealed no significant differences between ozone-fumigated and untreated spruces and between different damage categories. Probably, this is to be attributed to the high biological variability between the individual samples. The data obtained for the site 'Wank' did not point to any association to be statistically substantiated between a tree's degree of injury or site altitude and gibberellin content. Merely analyses of symptomless and chlorotic needles corroborated a significant influence on gibberellin content, which is probably due to a seasonal fluctuation of GA_3. The available data do not permit to conclude that the gibberellins GA_3 and GA_1 have physiological relevance for early indication of forest damage. (orig./UWA)

6628 (GSF–41/93) **Air pollutants and human health. Literature documentation. As of March 1993.** Kirchner, M.; Kohmanns, B.; Reuther, M.; Rossnagel, I.; Winkler, D. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Dec 1993. 272p. (In German). Order Number DE95726903. Source: OSTI; NTIS (US Sales Only); INIS.

This literature documentation for the subject 'Air pollutants and human health' lists 1180 quotations up to 1993 arranged in alphabetical order according to the first-named author. Each entry contains the ordinal number, author(s), title, source, and keywords. The appendix of the documentation contains a keyword index indicating the numbers of the relevant quotations and an authors' index permitting the retrieval of the second and next named authors via the quotation number. The quoted literature is largely present in the archives of the PBWU where it can be either consulted or borrowed. Computer-aided literature searches are performed on request. (UHE)

6629 (LA–12788-MS) **Staurosporine analysis and its pharmacokinetics in the blood of rats.** Gurley, L.R.; Umbarger, K.O.; Kim, J.M.; Bradbury, E.M.; Lehnert, B.E. Los Alamos National Lab., NM (United States). Jul 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE94013857. Source: OSTI; NTIS; INIS; GPO Dep.

Staurosporine (Stsp), a protein kinase inhibitor, has been found to have a differential effect on the proliferation of normal and transformed cells in vitro. Essentially nothing is known about the distribution and pharmacokinetics of Stsp in the body. To facilitate such investigations, we have developed a High-Performance Liquid Chromatography method for measuring the levels of Stsp in blood. Stsp was measured in both plasma and RBC of rat blood. In vivo, Stsp was rapidly sequestered in some other tissue compartment, which rapidly decreased the concentration of Stsp in plasma to nondetectable levels. Using a postchromatography computerized analysis program that amplified the Stsp UV absorption peak from the HPLC. nanogram levels of Stsp were detected in vivo. Using this detection system for pharmacokinetic studies it was found that, in vivo, Stsp had a half-life of 51.6 min in plasma and 75.3 min in RBC. Tissue adsorption studies demonstrated that up to 99% of the Stsp was adsorbed by the heart and lung tissue in one pass through these organs. Extrapolation of the data from these studies suggest that 1–g Stsp injections should produce a 2- to 7-ng/ml plasma Stsp level in vivo which is in the effective range to produce G1 arrest in normal cells. The short half-life of Stsp in plasma indicates that it will be necessary to infuse Stsp at some low level following the initial bolus injection in order to maintain Stsp levels in plasma at the 1- to 10-ng/ml level for the 2- to 3-day period necessary to achieve G1 arrest in vivo.

6630 (UCRL-JC–117823) **Characterization of mutagenic activity in grain-based coffee-substitute blends and instant coffees.** Johansson, M.A.E.; Knize, M.G.; Felton, J.S.; Jagerstad, M. Lawrence Livermore National Lab., CA (United States). Jun 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409260–1: 4. Euro-food tox meeting, No City Given (Poland), 12-16 Sep 1994). Order Number DE95003650. Source: OSTI; NTIS; GPO Dep.

Several grain-based coffee-substitute blends and instant coffees showed a mutagenic response in the Ames/Salmonella test using TA98, YG1024 and YG1O29 with metabolic activation. The beverage powders contained 150 to 500 TA98 and 1150 to 4050 YG1024 revertant colonies/gram, respectively. The mutagenic activity in the beverage powders was shown to be stable to heat and the products varied in resistance to acid nitrite treatment. Characterization of the mutagenic activity, using HPLC-and the Ames test of the collected fractions, showed the coffee-substitutes and instant coffees contain several mutagenic compounds, which are most likely aromatic amines.

5604 Other Environmental Pollutant Effects

6631 (NUREG/CR–5680-Vol.2) **The impact of environmental conditions on human performance: A critical review of the literature. Volume 2.** Echeverria, D. (Battelle Human Affairs Research Center, Seattle, WA (United States)); Barnes, V.; Bittner, A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Battelle Human Affairs Research Center, Seattle, WA (United States); Pacific Northwest Lab., Richland,

WA (United States). Sep 1994. 243p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (BHARC–700/91/005-Vol.2; PNL–7675-Vol.2). Source: OSTI; NTIS; INIS; GPO.

The Battelle Human Affairs Research Centers (HARC) conducted a comprehensive review of the technical literature regarding the impact of environmental conditions on human performance applicable to nuclear power plant workers. The environmental conditions considered were vibration, noise, heat, cold, and light. Research staff identified potential human performance deficits along a continuum of increasing occupational exposure, ranging from deficits that occur at low exposures to deficits that occur at high exposures. Specific deficits were included in the review if scientists demonstrated the exposure caused an effect, using sound methodology. The levels associated with each deficit were then compared to the protection afforded by existing occupational exposure standards. Volume 2 presents several conclusions regarding the applicability of the research literature to environmental conditions in nuclear power plants. The findings presented suggest that occupational standards for vibration, noise, and heat, which were developed to protect health, are inadequate for preventing deficits in cognitive or motor performance in tasks likely to be performed in nuclear power plants. Also, there is little information in the literature on simultaneous conditions; for example, the effects of simultaneous exposure to heat and noise on cognition require more research. As many exposures in nuclear power plants will be simultaneous, this limitation should be kept in mind when using Volume 1.

6632 (SAND–93-7095) **Noise and vibration investigations of the Sandia National Laboratories Sol se Mete Aerial Cable Facility.** Matise, B.K. (New Mexico State Univ., Las Cruces, NM (United States). Physical Science Lab.); Gutman, W.M.; Cunniff, R.A.; Silver, R.J.; Stepp, W.E. Sandia National Labs., Albuquerque, NM (United States); New Mexico State Univ., Las Cruces, NM (United States). Physical Science Lab. Nov 1994. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95003760. Source: OSTI; NTIS; GPO Dep.

This document is an assessment of the noise, vibration, and overpressure effects and fragmentation hazards of the operation of the Sandia National Laboratories Sol de Mete Aerial Cable Facility (ACF). Major noise sources associated with project operations and considered in this report include rocket motors, chemical explosions, 3-inch gun, 20-mm gun, vehicular traffic, and engines of electricity generators. In addition, construction equipment noise is considered. Noise exposure of ACF personnel is expressed as the equivalent sound level for the 8-hour work day, and is computed by scaling to the proper distance and combining the appropriate noise values for continuously operating equipment such as vehicles and generators. Explosions and gun firings are impulsive events, and overpressures are predicted and expressed as decibel (dB) at the control building, at other nearby facilities, at Sol se Mete. The conclusion reached in the noise analysis is that continuously operating equipment would not produce a serious noise hazard except in the immediate vicinity of the electricity generators and heavy equipment where hearing protection devices should be used. Rocket motors, guns, and detonations of less than 54 kilograms (kg) (120 lb) of explosives would not produce noise levels above the threshold for individual protection at the control building, other nearby test areas, or Sol se Mete Spring. Rare tests involving explosive weights between 54 and 454 kg (120 and 1,000 lb) could produce impulsive noise levels above 140 dB that would require evacuation or other provision for individual hearing protection at the ACF control building and at certain nearby facilities not associated with ACF. Other blast effects including overpressure, ground vibration, and fragmentation produce hazard radii that generally are small than the corresponding noise hazard radius, which is defined as the distance at which the predicted noise level drops to 140 dB.

Referat Oeffentlichkeitsarbeit. May 1993. 144p. (In German). Order Number DE95733392. Source: OSTI; NTIS (US Sales Only).

Since 1978 the Government of the Federal Republic of Germany has promoted health research through its programme "Research and Development in the Service of Health". The newly published programme for 1993-1998, Health Research 2000, continues with the aims already pursued in previous promotion periods. Its task is to coordinate research policy and control promotion policy in crucial areas. The programme has a transsectoral design and is managed jointly by the federal ministries of research and technology and of health. Research is to focus on the principal tasks of improving the protection of public health and prevention, doing research into the causes of and methods of treatment for disease, ensuring a future development of the national health system towards greater effectivity and economic sustainability, and improving the structure of health research. This is to be achieved through an integration of clinical and fundamental research. The appendix gives an overview of how the Federal Government finances health research, of promotion and research institutions, and of the contributions by other ministries to health research and promotion programmes of the EU. 6635 (CONF-9405258–, pp. 338-343) **Quality control for resistivity inversions. Part 1. Proposal of TQARI.** Haryu, T.; Nishikawa, M. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

Pertaining to the quality control for the resistivity inversions, the present paper reports the assessment of measurement data accuracy which influences the quality of analysis result. With referring actual examples of survey, the following explanation is given of the ratio of reciprocal error (RRE, index of separation due to the reciprocity between both current and voltage electrodes) as a grade assessment value of measurement error in the pole-pole electrode array, and two-dimensional resistivity survey and tomography by the pole-pole method: with a lengthening of distance between the measurement electrodes, the RRE rises generally. However, it is so influenced by the electrode earthing resistance and surface soil that its distribution becomes irregular. On the shallow subsurface, foreign conductor matter can be detected from the anomaly of RRE

distribution. However, its influence can be weakened in the process of analysis. The result of analysis with the round-trip data is more accurate than that only with the one-way data. 2 refs., 12 figs.

6636 (CONF-9405258–, pp. 455-459) **Electromagnetic physical modeling. 7.** Noguchi, K. (Waseda University, Tokyo (Japan). School of Science and Technology); Yoshioka, K.; Saito, A. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

This report presented the stabilizing method of system deconvolution process (a process in which the input function is obtained from the system output and the system function) in a model experiment. It was clarified that the stabilized deconvolution process required the spectra covering all range frequencies with relatively large magnitude and the measurement results obtained from the system response with sharp peaks. A pseudo-impulse method was proposed to response the measurement results obtained under the conditions which did not meet the above-said requirement. The solution of deconvolution process was resulted from the input function and the pseudo-impulse method. Selecting adequately the falseness in the pseudo-impulse method improves the deconvolution process results. A model experiment of the electromagnetic response of the agglomerated spheres was also conducted. The conductivity of the agglomerate was lower than the intrinsic conductivity of the material which composed the sphere. 6 refs., 14 figs., 2 tabs.

6637 (CONF-9405258–, pp. 474-478) **Magnetic susceptibility and resistivity imaging multifrequency controlled source EM technique.** Sakashita, S. (OYO Corp., Tokyo (Japan)); Shima, H.; Gasnier, S. Society of Exploration Geophysicists of Japan, Tokyo (Japan). May 1994. 539p. (In Japanese). From 90. SEGJ conference; Tokyo (Japan); 25-27 May 1994. In *Proceedings of the 90th (Spring of fiscal 1994) SEGJ (The Society of Exploration Geophysicists of Japan) Conference.* Order Number DE95722746. Source: OSTI; NTIS; Available from The Society of Exploration Geophysicists of Japan, 2-18, Nakamagome 2-chome, Ota-ku, Tokyo, Japan.

The following is reported about the magnetic susceptibility and resistivity imaging by EM tomography with a multi-frequency and multi-component measurement device: it was verified by model test that the linear Born approximation is appropriately used for the sequential calculation of magnetic susceptibility. Through a numerical test with a ground model where the actual distribution of magnetic susceptibility was simulated, it was confirmed that the secondary magnetic field generated in response to such magnetic susceptibility has sufficient signal strength for the natural magnetic field, and that, unless the magnetic susceptibility of ground is very low, the reverse analysis is effective in restructuring the distribution of magnetic susceptibility. Through an in-situ test with an EM tomographic measurement device which was so developed by Sakashita et al. as to obtain multi-frequency data in the region of frequencies between approx. 4Hz and approx. 17.9kHz, it was shown that the present system can measure the magnetic field with sufficient accuracy for the resistivity imaging. 7 refs., 12 figs.

6638 (ENRESA–05/94) **West Europe and Iberian Peninsula from 120.000 years ago to the present: glacial isostacy, paleogeography and paleotemperatures.** Garcin, M. (Bureau de recherches geologiques et minieres (BRGM), Servicio Geologico Natural, Departamento de Geologia (France)). No corporate text available. 1994. 86p. (In Spanish). Order Number DE95721639. Source: OSTI; NTIS.

The main objective of this paper is to describe the Occidental Europe and Iberian Peninsula during the last glacial cycle. This project has been done within the software Geoprospect, developed by BRGM.

6639 (LA-UR–94-2956) **Bursting in the near-surface boundary layer: Comparisons between realistic models and observations.** ReVelle, D.O.; Coulter, R.C. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9403185–1: American Meterorlogical Society conference on boundary layers and turbulence, Charlotte, NC (United States), 27-31 Mar 1994). Order Number DE95003714. Source: OSTI; NTIS; GPO Dep.

In this paper, the authors examine the stable, nocturnal boundary layer, bursting phenomena. Bursting (or intermittent breakdowns from turbulent to laminar flow) can occur if the critical Richardson number, Ri_c, is exceeded. During the bursting process, which occurs at irregular, chaotic intervals, periods of active turbulence (large sudden changes in u') are followed by calm periods when the air temperatures near the ground can drop rapidly. During the turbulent periods, air temperatures can also rise considerably.

6640 (NUREG/CR–6258) **The liquefaction method for assessing paleoseismicity.** Tuttle, M.P. (Columbia Univ., Palisades, NY (United States). Lamont-Doherty Earth Observatory). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Columbia Univ., Palisades, NY (United States). Lamont-Doherty Earth Observatory. Dec 1994. 39p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

Paleoseismicity studies expand our knowledge of seismic activity into the prehistoric period and thereby can improve our understanding of the earthquake potential of various regions. Paleoseismology is proving especially useful in eastern North America, where the recurrence interval of large earthquakes is longer than the historic record of earthquakes. Because surface traces of seismogenic faults have been difficult to identify in eastern North America, most paleoseismicity studies have employed features resulting from liquefaction. The goals of paleoliquefaction studies are to determine the recurrence intervals, magnitudes, and source areas of prehistoric earthquakes. To accomplish these goals, one must be able to identify earthquake-induced liquefaction features, determine their ages, and map their distribution. This report reviews (1) characteristics of earthquake-induced liquefaction features as well as other soft-sediment deformation structures, (2) methods for dating liquefaction features, and (3) relationships between liquefaction and the magnitude and distance of causative earthquakes. Recent studies by the author in Quebec Province, Canada and in the New Madrid seismic zone of the central United States provide the basis for this report. For additional information on the use of liquefaction features in paleoseismology see Amick et al. (1990) and Obermeier et al. (1990 and 1992).

6643 (CEA-N–2714) **Numerical resolution of the time-domain three-dimensional Maxwell equations by a conform finite element approximation. Part I: theoretical formulation.** Heintze, E. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1993. 52p. (In French). Order Number DE95611429. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this report is to present a method for solving the time-domain three-dimensional Maxwell equations. This method is based on a variational formulation and can be easily coupled with a particle solver for the Vlasov equation. The necessity to take into account complex three-dimensional geometries and to have a spatial resolution fitted to the various computation zones, leads to choose a finite element method built on tetrahedral unstructured meshes. 12 refs.

6644 (CEA-N–2715) **Numerical resolution of the time-domain three-dimensional Maxwell equations by a conform finite element approximation. Part II: numerical results.** Heintze, E. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1993. 58p. (In French). Order Number DE95611430. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this report is to validate the program MAX3D built up from the discretization of the formulation (FB) established in part 1. A qualitative and quantitative analysis is carried out on numerical results obtained with various test cases of which, for most of them, analytical solutions are known. 32 figs., 3 refs.

6645 (DESY–94-122) **Thermodynamic and multifractal formalism and the Bowen-series map.** Rudolph, O. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Phy k). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 110p. Order Number DE95725986. Source: OSTI; NTIS (US Sales Only); INIS.

In the theory of quantum chaos one studies the semiclassical behaviour of quantum mechanical systems whose corresponding classical counterparts exhibit chaos. These systems are sometimes considered as model systems in the theory of quantum chaos since they are well understood from a mathematical point of view. In this work we study the multifractal formalism for the geodesic flow on surfaces with constant negative curvature. The multifractal analysis of measures has been developed in order to characterize the scaling behaviour of measures on attractors of classical chaotic dynamical systems globally. In order to relate the multifractal formalism with quantities usually considered in the study of the geodesic flow on Riemann surfaces with constant negative curvature, it is necessary to establish the assertions of the multifractal formalism in a mathematically rigorous way. This is achieved with the help of the thermodynamic formalism for hyperbolic dynamical systems developed by Ruelle, Bowen and others. (orig.)

6646 (DESY–94-141) **Observation and superselection in quantum mechanics.** Landsman, N.P. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 40p. Order Number DE95725662. Source: OSTI; NTIS (US Sales Only); INIS.

We attempt to clarify the main conceptual issues in approaches to 'objectification' or 'measurement' in quantum mechanics which are based on superselection rules. Such approaches venture to derive the emergence of classical 'reality' relative to a class of observers; those believing that the classical world exists intrinsically and absolutely are advised against reading this paper. The prototype approach (Hepp) where superselection sectors are assumed in the state space of the apparatus is shown to be untenable. Instead, one should couple system and apparatus to an environment, and postulate superselection rules for the latter. These are motivated by the locality of any observer or other (actual or virtual) monitoring system. In this way 'environmental' solutions to the measurement problem (Zeh, Zurek) become consistent and acceptable, too. Points of contact with the modal interpretation are briefly discussed. We propose a minimal value attribution to observables in theories with superselection rules, in which only central observables have properties. In particular, the eigenvalue link is dropped. This is mainly motivated by Ockham's razor. (orig.)

6647 (ETDE/JP-mf–95730105) **Study of very high temperature technology. 2.** National Inst. for Research in Inorganic Materials, Tsukuba (Japan). 25 Nov 1993. 52p. (In Japanese). Order Number DE95730105. Source: OSTI; NTIS; Available from National Institute for Research in Inorganic Materials, 1-1, Namiki, Tsukuba, Ibaraki, Japan.

This paper is a collection of research reports of 1993 regarding very high temperature technology published by Japan Science and Technology Agency. High-frequency thermal plasma (RF plasma) under the very high temperature generation method in the very high temperature (4000 - 10000 °C) processing technology that has recently been attracting attention of the industry have various features. The high-reactive chemical species in plasma have the same important reaction as found in diamond thin film synthesis. As an application technology, the torch is essential for generating plasma for a long time. The torch for creating the characteristic chemical species should be developed as an important factor. The measurement technologies were developed involving in these generation technologies. The main study of the very high temperature station is the development of the very high temperature generation mechanism and the application technologies. The study overview presents the development of generation system, plasma stability, measurement control, application technologies, simultaneous emission of RF plasma and UV laser, phase transfer of α-alumina in plasma, and others. Related researches are separately collected and attached to the paper as the supplement. As a result of these researches, 43 reports were presented on the paper, and 4 patents were applied in Japan. 96 refs., 82 figs., 6 tabs.

6648 (JAERI-Research–94-018) **Low-energy ion-beam deposition apparatus equipped with surface analysis system.** Ohno, Hideki (Meisei Univ., Hino, Tokyo (Japan)); Aoki, Yasushi; Nagai, Siro. Japan Atomic Energy Research Inst., Tokyo (Japan). Oct 1994. 51p. (In Japanese). Order Number DE95737272. Source: OSTI; NTIS; INIS.

A sophisticated apparatus for low energy ion beam deposition (IBD) was installed at Takasaki Radiation Chemistry Research Establishment of JAERI in March 1991. The apparatus is composed of an IBD system and a real time/in-situ surface analysis system for diagnosing deposited thin films. The IBD system provides various kinds of low energy ion down to 10 eV with current density of 10 μA/cm^2 and irradiation area of 15x15 mm^2. The surface analysis system consists of RHEED, AES, ISS and SIMS. This report describes the characteristics and the operation procedure of the apparatus together with some experimental results on depositing thin carbon films. (author).

6649 (UCRL-JC–115963) **Coplanar multiple-ring electrostatic particle-beam lenses.** Moran, M.J. Lawrence Livermore National Lab., CA (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9401108–1: 38. international symposium on electron, ion and photon beam, New Orleans, LA (United States), 7 Jan 1994). Order Number DE95003643. Source: OSTI; NTIS; INIS; GPO Dep.

Electrostatic particle-beam lenses using a concentric co-planar array of independently biased rings can be advantageous for some applications. Traditional electrostatic lenses often consist of axial series of biased rings, apertures, or tubes. The science of lens design has devoted much attention to finding axial arrangements that compensate for the substantial optical aberrations of the individual elements. Thus, as with multi-element lenses for light, a multi-element charged-particle lens can have optical behavior that is far superior to that of the individual elements. This paper discusses

the possibility that transverse multiple-concentric-ring lenses can achieve high performance, while also having advantages in terms of compactness and optical versatility.

6613 Other Aspects of Physical Science

6650 (DOE/ER/40272–206) **A quantum gravitational mechanism for exiting inflation.** Woodard, R.P. Florida Univ., Gainesville, FL (United States). Dept. of Physics. Aug 1994. 11p. Sponsored by USDOE, Washington, DC (United States);North Atlantic Treaty Organization, Brussels (Belgium). DOE Contract FG05-86ER40272. Grant CRG-910627. (CONF-9406248–5: Workshop on quantum infrared physics, Paris (France), Jun 1994). Order Number DE95003342. Source: OSTI; NTIS; INIS; GPO Dep.

I discuss the proposal by Nick Tsamis and myself that quantum gravity may mediate a naturally slow exit from inflation. The emphasis is on our recently completed two loop computation of the effective Hubble constant. When this result is properly checked and independently confirmed it will provide a proof that the mechanism functions in perturbation theory.

6651 (DOE/ER/40317–13) **Research in nuclear astrophysics: Stellar collapse and supernovae. Continuation progress report, December 1, 1994–November 30, 1995.** Lattimer, J.M.; Yahil, A. State Univ. of New York, Stony Brook, NY (United States). Dept. of Earth and Space Sciences. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER40317. Order Number DE95004300. Source: OSTI; NTIS; GPO Dep.

This progress report describes the nuclear astrophysics research activities in the Earth and Space Sciences Department at Stony Brook during the last year. The research focuses on three aspects of nuclear astrophysics: (1) the equation of state of hot, dense matter, (2) the origin of supernovae and neutron stars, (3) the early cooling epoch of neutron stars. Ongoing projects are first described individually, and are followed by a series of detailed reports, which summarize each project completed within the last year.

6652 (DOE/ER/40561–170) **Core-collapse supernovae and nucleosynthesis.** Haxton, W.C. Washington Univ., Seattle, WA (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract FG06-90ER40561. Grant NAGW2523. (CONF-9409270–1: 3. school on astrofundamental physics, Erice (Italy), Sep 1994). Order Number DE95004357. Source: OSTI; NTIS; INIS; GPO Dep.

I discuss some of the physics that governs the collapse and explosion of a massive star, including issues such as lepton number losses in the infall stage and neutrino heating and convection following the core bounce. I review recent work on the neutrino process and the r-process, describing how the nucleosynthesis depends on the explosion mechanism. Some of the interesting possibilities for oscillations of closure mass ν_τs are discussed, along with their signatures in terrestrial detectors and in nucleosynthesis.

6653 (LA-UR–93-1428) **A study of ultra high energy radiation associated with Hercules X-1.** Biller, S.D. California Univ., Irvine, CA (United States). 1992. 273p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95003508. Source: OSTI; NTIS; INIS; GPO Dep.

Data from the CYGNUS experiment has been used to examine ultra high energy (UHE) radiation associated with the X-ray binary star system Hercules X-1. A search for both pulsed, and unpulsed emission over time scales ranging from minutes to years has failed to yield a result of comparable significance to that of the previously published observation of July 24, 1986. A reassessment of this result in light of the number of hypotheses that have been examined for Hercules X-1 yields a probability estimate of 0.44% that the data is consistent with background fluctuations. If the number of independent source hypotheses is also accounted for, an overall chance probability of 1.8% is assessed for the observations of the CYGNUS experiment. The extensive air showers corresponding to the episode of July 24, 1986 contain a substantial muon content, in contradiction with traditional predictions for primary gamma-rays. No satisfactory theory has yet been put forward to explain this phenomenon. A further analysis of shower characteristics for events associated with this episode indicates a steeper radial dependence of the showerfront timing width at a chance probability level of 0.16%. This property might be explained by a model that invokes a forward-peaked and/or a deeply interacting component of the hadronic interaction in the atmosphere. The potential importance of UHE observations of Hercules X-1 is great. however the evidence is not yet compelling. Further observations will be necessary, to confirm the potential properties of associated UHE radiation.

6654 (LA-UR–94-2077) **A theory for the morphology of Laplacian growth from statistics of equivalent many-body Hamiltonian systems.** Blumenfeld, R. Los Alamos National Lab., NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950221–1: 3. international working conference on fractals in the natural and applied sciences, Marseille (France), 7-10 Feb 1995). Order Number DE94014473. Source: OSTI; NTIS; GPO Dep.

The evolution of two dimensional interfaces in a Laplacian field is discussed. By mapping the growing region conformally onto the unit disk, the problem is converted to the dynamics of a many-body system. This problem is shown to be Hamiltonian. An extension of the many body approach to a continuous density is discussed. The Hamiltonian structure allows introduction of surface effects as an external field. These results are used to formulate a first-principles statistical theory for the morphology of the interface using statistical mechanics for the many-body system.

6655 (LA-UR–94-3766) **CDM and Omega in the local neighborhood.** Dunn, A.M. (Univ. of Cambridge (United Kingdom). Institute of Astronomy); Laflamme, R. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940816–57: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003683. Source: OSTI; NTIS; INIS; GPO Dep.

Peebles has suggested an interesting method to trace back in time positions of galaxies called the least action method. This method applied on the Local Group galaxies seems to indicate that we live in an $\Omega \approx 0.1$ Universe. The authors have studied a cold dark matter (CDM) N-body simulation with $\Omega = 0.2$ and $H = 50 \mathrm{kms}^{-1}$/Mpc and compare trajectories traced back from the Least Action Principle and the center of mass of the particle forming CDM halos. They have shown that the agreement between these set of trajectories is at best qualitative. They have also shown that the line of sight peculiar velocities are underestimated. This discrepancy is due to orphans, CDM particles which do not end up in halos. By varying the density parameter Ω in the least action principle the authors show that using this method they would underestimate the density of the Universe by a factor of 4-5.

6656 (LA-UR–94-3937) **Resolution of the classical Hyades lithium problem.** Faulkner, J. (Univ. of California, Santa Cruz, CA (United States). Lick Observatory and Astronomy Board); Swenson, F.J. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9405264–1: Light element abundances, Elba (Italy), 23-28 May 1994). Order Number DE95003661. Source: OSTI; NTIS; GPO Dep.

For the very first time, it has recently proved possible to make a well-motivated, physically plausible, and self-consistent prediction of the Hyades G- and K-dwarf (Li,T_{eff}) relationship that matches the long-unexplained observations. The method employs the latest Iglesias &, Rogers (OPAL) interior opacities and Alexander surface opacities (whose respective values are now themselves close to empirical predictions or estimates made earlier in this Hyades project), King's recently discovered [O/Fe] enhancement (another prediction!) and utterly conventional PMS (pre-main-sequence) evolution unaided by arbitrary and ad hoc adjustable parameters. Thus, the following assumptions form a self-consistent set explaining the Hyades G- and K-dwarf (Li,T_{eff}) observations: (i) Pop. I interior opacities are now essentially correct; (ii) Pop. I surface

opacities are now essentially correct; (iii) The Hyades distance is now essentially correct; (iv) The Hyades [Fe/H] and [O/Fe] are now essentially correct, and possible changes in [Ne, Mg., or Si/Fe] are likely to have only a small effect; (v) Convective envelope overshooting is negligible; (vi) Quarreling with the above means finding at least two compensating errors in assumptions (i) through (v).

6657 (LA-UR–94-3953) **Theoretical motivation for gravitation experiments on ultra-low energy antiprotons and antihydrogen.** Nieto, M.M. Los Alamos National Lab., NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409264–1: Low-energy antiproton physics, Bled (Slovenia), 12-17 Sep 1994). Order Number DE95003662. Source: OSTI; NTIS; INIS; GPO Dep.

It is known that the generally accepted theories of gravity and quantum mechanics are fundamentally incompatible. Thus, when one tries to combine these theories, one must beware of physical pitfalls. Modern theories of quantum gravity are trying to overcome these problems. Any ideas must confront the present agreement with general relativity, but yet be free to wonder about not understood phenomena, such as the dark matter problem. This all has led some "intrepid" theorists to consider a new gravitational regime, that of antimatter. Even more "daring" experimentalists are attempting, or considering attempting, the measurement of the gravitational force on antimatter, including low-energy antiprotons and, perhaps most enticing, antihydrogen.

6658 (SAND–93-2557C) **Axial focusing of impact energy in the earth's interior: A possible link to flood basalts and hotspots.** Boslough, M.B.; Chael, E.P.; Trucano, T.G.; Crawford, D.A.; Campbell, D.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940285–1: New developments regarding the KT event and other catastrophes in earth history, Houston, TX (United States), 9-12 Feb 1994). Order Number DE95003357. Source: OSTI; NTIS; GPO Dep.

We present the results of shock physics and seismological computational simulations that show how energy from a large impact can be coupled to the interior of the Earth. The radially-diverging shock wave generated by the impact decays to linearly elastic seismic waves. These waves reconverge (minus attenuation) along the axis of symmetry between the impact and its antipode. The locations that experience the most strain cycles with the largest amplitudes will dissipate the most energy and have the largest increases in temperature (for a given attenuation efficiency). We have shown that the locus of maximum energy deposition in the mantle lies along the impact axis. Moreover, the most intense focusing is within the asthenosphere at the antipode, within the range of depths where mechanical energy is most readily converted to heat. We propose that if large impacts on the Earth leave geological evidence anywhere other than the impact site itself, it will be at the antipode. We suggest that the most likely result of the focusing for a sufficiently large impact, consistent with features observed in the geological record, would be a flood basalt eruption at the antipode followed by hotspot volcanism. A direct prediction of this model would be the existence of undiscovered impact structures whose reconstructed locations would be antipodal to flood basalt provinces. One such structure would be in the Indian Ocean, associated with the Columbia River Basalts and Yellowstone; another would be a second K/T impact structure in the Pacific Ocean, associated with the Deccan Traps and Reunion.

6659 (SAND–94-1186C) **High gain GaAs Photoconductive Semiconductor Switches (PCSS): Device lifetime, high current testing, optical pulse generators.** Zutavern, F.J.; Loubriel, G.M.; Helgeson, W.D.; O'Malley, M.W.; Gallegos, R.R.; Hjalmarson, H.P.; Baca, A.G.; Plut, T.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941006–3: Annual conference of the Optical Society of America and exhibit, Boston, MA (United States), 30 Oct - 4 nov 1994). Order Number DE95003354. Source: OSTI; NTIS; GPO Dep.

This paper presents results from three areas of GaAs PCSS research and development: device lifetime, high current switching, and PCSS-driven laser diode arrays (LDA). The authors have performed device lifetime tests on both lateral and vertical switches as a function of current amplitude, pulse width, and charging time. At present, their longest-lived switch reached 4×10^6 pulses. Scanning electron microscope (SEM) images show damage near the contacts even after only 5 pulses. They are presently searching for the threshold at which no damage is evident after a single shot. In high current tests, they have reached 5.2 kA at 4.2 kV. This was achieved using twenty fiber-optic coupled lasers to distribute current filaments over a 5 mm wide PCSS. Current waveforms and images of the current filaments as a function of current amplitude will be presented. The lasers used to trigger the high current PCSS were driven with a miniature PCSS. Low inductance, high speed GaAs PCSS are very effective as short pulse laser diode array drivers. Some types of arrays gain switch, producing a compressed optical pulse which is only 75 ps wide. Results from tests with a variety of laser diode arrays will be presented.

6660 (SAND–94-1816C) **Axial focusing of energy from a hypervelocity impact on earth.** Boslough, M.B.; Chael, E.P.; Trucano, T.G.; Crawford, D.A. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410131–11: 1994 hypervelocity impact symposium, Santa Fe, NM (United States), 16-20 Oct 1994). Order Number DE95003347. Source: OSTI; NTIS; INIS; GPO Dep.

We have performed computational simulations to determine how energy from a large hypervelocity impact on the Earth's surface would couple to its interior. Because of the first-order axial symmetry of both the impact energy source and the stress-wave velocity structure of the Earth, a disproportionate amount of energy is dissipated along the axis defined by the impact point and its antipode (point opposite the impact). For a symmetric and homogeneous Earth model, all the impact energy that is radiated as seismic waves into the Earth at a given takeoff angle (ray parameter), independent of azimuthal direction, is refocused (minus attenuation) on the axis of symmetry, regardless of the number of reflections and refractions it has experienced. Material on or near the axis of symmetry experiences more strain cycles with much greater amplitude than elsewhere, and therefore experiences more irreversible heating. The focusing is most intense in the upper mantle, within the asthenosphere, where seismic energy is most effectively converted to heat. For a sufficiently energetic impact, this mechanism might generate enough local heating to create an isostatic instability leading to uplift, possibly resulting in rifting, volcanism, or other rearrangement of the interior dynamics of the planet. These simulations demonstrate how hypervelocity impact energy can be transported to the Earth's interior, supporting the possibility of a causal link between large impacts on Earth and major internally-driven geophysical processes.

6661 (SLAC-PUB–6671) **Crossing symmetry is incompatible with general relativity.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9407129–3: 7. Marcel Grossman meeting on general relativity, Stanford, CA (United States), 24-29 Jul 1994). 6620 Physics of Elementary Particles and Fields

6662 (DOE/ER–0614P) **High energy physics advisory panel's subpanel on vision for the future of high-energy physics.** USDOE Office of Energy Research, Washington, DC (United States). High Energy Physics Div. May 1994. 157p. Sponsored by USDOE, Washington, DC (United States). Order Number DE94013641. Source: OSTI; NTIS; INIS; GPO Dep.

This report was requested by the Secretary of Energy to (1) define a long-term program for pursuing the most important high-energy physics goals since the termination of the Superconducting Super Collider (SSC) project, (2) assess the current US high-energy physics program, and (3) make recommendations regarding

the future of the field. Subjects on which recommendations were sought and which the report addresses were: high-energy physics funding priorities; facilitating international collaboration for future construction of large high-energy physics facilities; optimizing uses of the investment made in the SSC; how to encourage displaced scientists and engineers to remain in high-energy physics and to attract young scientists to enter the field in the future. The report includes a description of the state of high-energy physics research in the context of history, a summary of the SSC project, and documentation of the report's own origins and development.

6663 (DOE/ER/02504–341) **High Energy Accelerator and Colliding Beam User Group. Progress report, May 1, 1980–March 31, 1981.** Snow, G.A. Maryland Univ., College Park, MD (United States). Dec 1980. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76ER02504. Order Number DE94014071. Source: OSTI; NTIS; GPO Dep.

The major activities of the High Energy Physics Group at the University of Maryland during the current contract period have been: analysis of e^+e^- events from the PLUTO detector at PETRA, design and construction of modifications to PLUTO for 2γ physics, analyses of $\nu_\mu D_2$ bubble chamber pictures from Fermilab, completion of the $\nu_\mu e$ elastic scattering experiment at Fermilab, development and demonstration of an ultra cold neutron source produced by Doppler shifting, testing of equipment for the hadron jet experiment at Fermilab that is about to begin, and planning for large projects in the future.

6664 (DOE/ER/40103–T6) **Final technical report: DOE-High Energy Physics contract with the University of Hawaii.** Hawaii Univ., Honolulu, HI (United States). [1995]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-83ER40103. Order Number DE95004214. Source: OSTI; NTIS; INIS; GPO Dep.

This report is divided into two sections: (1) experimental program; and (2) theoretical program. In each case the report includes a highly condensed summary of the major developments on various Hawaii projects. The various experimental programs in which Hawaii played a significant role during this period are: (1) neutrino bubble chamber experiments; (2) electron-positron colliding beams; (3) development of silicon particle-position detectors for HEP; (4) proton decay search; (5) high energy gamma-ray astronomy; and (6) DUMAND project. The theoretical programs are: (1) research in neutrino physics; (2) supernova neutrinos; (3) solar neutrinos; (4) atmospheric neutrinos; (5) searching for supersymmetry; (6) Higgs boson searches; (7) simulation of supersymmetry; (8) signals of R-parity violation; (9) leptoquarks, stable heavy particles and other exotica; (10) CP non conservation; (11) neutron electron dipole moment; (12) heavy quark physics; and (13) hadron spectroscopy.

6665 (LBL–91-Rev.-8/94) **Current experiments in elementary particle physics. Revision.** Galic, H. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Armstrong, F.E.; von Przewoski, B. Lawrence Berkeley Lab., CA (United States); Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 174p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098 ; AC03-76SF00515. Order Number DE95003797. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains summaries of 568 current and recent experiments in elementary particle physics. Experiments that finished taking data before 1988 are excluded. Included are experiments at BEPC (Beijing), BNL, CEBAF, CERN, CESR, DESY, FNAL, INS (Tokyo), ITEP (Moscow), IUCF (Bloomington), KEK, LAMPF, Novosibirsk, PNPI (St. Petersburg), PSI, Saclay, Serpukhov, SLAC, and TRIUMF, and also several underground and underwater experiments. Instructions are given for remote searching of the computer database (maintained under the SLAC/SPIRES system) that contains the summaries.

6621 General Theory of Particles and Fields

6666 (CEA-N–2722) **Spin and intrinsic angular momentum; application to the electromagnetic field.** Paillere, P. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). May 1993. 55p. (In French). Order Number DE95611462. Source: OSTI; NTIS (US Sales Only); INIS.

Within the framework of the field theory governed by a Lagrangian, function of the tensor quantities and their covariant first derivatives, and starting with the third order intrinsic angular momentum tensor obtained from a variational principle, the intrinsic angular momentum vector of the electromagnetic field in vacuum is determined. This expression leads to spin matrices for the electromagnetic field, with unity as eigenvalue, thus allowing to bridge the gap between continuous physics and quantum physics. 6 refs.

6667 (DESY–94-135) **Renormalization group flow in a general gauge theory.** Skarke, H. (Hamburg Univ. (Germany). 1. Inst. fuer Theoretische Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 13p. (ITP-UH–10/94; HEP-TH–9407086). Order Number DE95725956. Source: OSTI; NTIS (US Sales Only); INIS.

The renormalization group flow in a general renormalizable gauge theory with a simple gauge group in 3+1 dimensions is analyzed. The flow of the ratios of the Yukawa couplings and the gauge coupling is described in terms of a bounded potential, which makes it possible to draw a number of non-trivial conclusions concerning the asymptotic structure of the theory. A classification of possible flow patterns is given. (orig.)

6668 (DESY–94-150) **Spectrum of the Dirac operator and multigrid algorithm with dynamical staggered fermions.** Kalkreuter, T. (Kaiserslautern Univ. (Germany). Fachbereich Physik). Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 21p. Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). (HUB-IEP–94/12; KL-TH–19/94). Order Number DE95725566. Source: OSTI; NTIS (US Sales Only); INIS.

Complete spectra of the staggered Dirac operator D are determined in quenched four-dimensional SU(2) gauge fields, and also in the presence of dynamical fermions. Periodic as well as antiperiodic boundary conditions are used. An attempt is made to relate the performance of multigrid (MG) and conjugate gradient (CG) algorithms for propagators with the distribution of the eigenvalues of D. The convergence of the CG algorithm is determined only by the condition number k and by the lattice size. Since k's do not vary signigicantly when quarks become dynamic, CG convergence in unquenched fields can be predicted from quenched simulations. On the other hand, MG convergence is not affected by k but depends on the spectrum in a more subtle way. (orig.)

6669 (DESY–94-157) **Metaplectic spinor fields and global anomalies.** Reuter, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Sep 1994. 29p. Order Number DE95731949. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate spinor fields on phase-spaces. Under local frame-rotations they transform according to the (infinite-dimensional, unitary) metaplectic representation of Sp(2N) which plays a role analogous to the Lorentz group. We introduce a one-dimensional nonlinear sigma-model whose target space is the phase-space under consideration. The global anomalies of this model are analyzed, and it is shown that its fermionic partition function is anomalous exactly if the underlying phase-space is not a spin-manifold, i.e., if metaplectic spinor fields cannot be introduced consistently. The sigma-model is constructed by giving a path-integral representation to the Lie-transport of spinors along the hamiltonian flow. (orig.)

6670 (INS–1038) **Non-critical string field theory with non-orientable string interactions.** Watabiki, Yoshiyuki. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jun 1994. 16p. Order Number DE95737160. Source: OSTI; NTIS; INIS.

We study the non-critical string field theory with non-orientable string interactions by using the transfer matrix formalism in the dynamical triangulation. For any value of c (total central charge of matter), we have constructed the non-orientable string field theory at the discrete level. Two coupling constants G and G' which satisfy the relation $(G')^3=GG'$ are introduced, where G counts the number of untwisted handles of the world-sheet while G' counts

the number of cross-caps. In the case of the non-critical string theory which correspond to multicritical one matrix models (including c=0 case), we have succeeded in taking the continuum limit, and then have obtained the continuous string field theory. (author).

6671 (INS–1042) **Quantization of a relativistic particle on the SL(2.R) manifold based on Hamiltonian reduction.** Jorjadze, G. (AN Gruzinskoj SSR, Tbilisi (Georgia). Tbilisskij Matematicheskij Inst.); O'Raifeartaigh, L.; Tsutsui, I. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1994. 13p. Order Number DE95737163. Source: OSTI; NTIS; INIS.

A quantum theory is constructed for the system of a relativistic particle with mass m moving freely on the SL(2.R) group manifold. Applied to the cotangent bundle of SL(2.R). the method of Hamiltonian reduction allows us to split the reduced system into two coadjoint orbits of the group. We find that the Hilbert space consists of states given by the discrete series of the unitary irreducible representations of SL(2.R). and with a positive-definite, discrete spectrum. (author).

6672 (INS–1043) **On the string equation at c=1.** Nakatsu, Toshio. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1994. 18p. Order Number DE95737161. Source: OSTI; NTIS; INIS.

The analogue of the string equation which specifies the partition function of c=1 string with a compactification radius β is an element of $Z_{\geq 1}$ is described in the framework of Toda lattice hierarchy. (author).

6673 (INS–1047) **The topological string associated with a simple singularity of type D.** Nakatsu, Toshio. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Aug 1994. 15p. Order Number DE95737229. Source: OSTI; NTIS; INIS.

The partition function of D_{N+1} topological string, the coupled system of topological gravity and D_{N+1} topological minimal matter, is proposed in the framework of KP hierarchy. It is specified by the elements of GL(∞) which constitute the deformed family from the A_{2N-1} topological string. Its dispersionless limit is investigated from the view of both dispersionless KP hierarchy and singularity theory. In particular the free energy restricted on the small phase space coincides with that for the topological Landau-Ginzburg model of type D_{N+1}. (author).

6674 (INS–1048) **Global aspects of the WZNW reduction to Toda theories.** Tsutsui, I.; Feher, L. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Aug 1994. 23p. Order Number DE95737230. Source: OSTI; NTIS; INIS.

It is well-known that the Toda Theories can be obtained by reduction from the Wess-Zumino-Novikov-Witten (WZNW) model, but it is less known that this WZNW → Toda reduction is 'incomplete'. The reason for this incompleteness being that the Gauss decomposition used to define the Toda fields from the WZNW field is valid locally but not globally over the WZNW group manifold, which implies that actually the reduced system is not just the Toda theory but has much richer structures. In this note we furnish a framework which allows us to study the reduced system globally, and thereby present some preliminary results on the global aspects. For simplicity, we analyze primarily 0+1 dimensional toy models for G=SL(n,R), but we also discuss the 1+1 dimensional model for G=SL(2,R) which corresponds to the WZNW → Liouville reduction. (author).

6675 (LA-UR–94-3816) **Φ^4 kinks: Statistical mechanics.** Habib, S. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409241–4: NEEDS '94, Los Alamos, NM (United States), 12-16 Sep 1994). Order Number DE95003693. Source: OSTI; NTIS; GPO Dep.

Some recent investigations of the thermal equilibrium properties of kinks in a 1+1-dimensional, classical ϕ^4 field theory are reviewed. The distribution function, kink density, correlation function, and certain thermodynamic quantities were studied both theoretically and via large scale simulations. A simple double Gaussian variational approach within the transfer operator formalism was shown to give good results in the intermediate temperature range where the dilute gas theory is known to fail.

6676 (LA-UR–94-3852) **Disorder-induced breakdown of soliton and polaron particles.** Bishop, A.R.; Cai, D.; Gronbech-Jensen, N.; Salkola, M.I. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409182–2: Fluctuation phenomena: disorder and nonlinearity conference, Madrid (Spain), 26-30 Sep 1994). Order Number DE95003694. Source: OSTI; NTIS; GPO Dep.

Using examples of the perturbed (1+1) dimensional sine-Gordon, the continuous and discrete nonlinear Schroedinger systems, and a three-site quantum polaron problem, the authors briefly review some phenomena related to the fascinating interplays between nonlinearity, disorder, noise, nonadiabaticity, and lattice discreteness. The concept of competing length-scales and time-scales is emphasized as they pertain to the common concept of solitons and polarons behaving as "particles."

6677 (UM-P–93/62) **A new formulation of quantum field theory on S_4.** Harris, B.A.; Joshi, G.C. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1993]. 42p. (UM-P–91/50; UM-P–92/72.). Order Number DE95607098. Source: OSTI; NTIS (US Sales Only); INIS.

Recent developments in quantum gravity suggest that wormholes may influence the observed values of the constants of nature. The Euclidean formulation of quantum gravity predicts that wormholes induce a probability distribution in the space of possible fundamentals constants. In particular, the effective action on a large spherical space may lead to the vanishing of the cosmological constant and possibly determine the values of other constants of nature. The ability to perform calculations involving interacting quantum fields, particularly non-Abelian models, on a four-sphere is vital if one is to investigate this possibility. In this paper, a new formulation of field theory on a four-sphere is presented using the angular momentum space representation of SO(5). A review of field theory on a sphere is given and then show how a matrix element prescription in angular momentum space and a new summation technique based on the complex l-plane, overcome previous limitations in calculation techniques. The standard one-loop graphs of QED are given as examples. 13 refs., 3 figs.

6678 (BNL–48922-Rev.4/94) **PHENIX CDR update: An experiment to be performed at the Brookhaven National Laboratory relativistic heavy ion collider. Revision.** Brookhaven National Lab., Upton, NY (United States). Nov 1994. 297p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95003026. Source: OSTI; NTIS; INIS; GPO Dep.

The PHENIX Conceptual Design Report Update (CDR Update) is intended for use together with the Conceptual Design Report (CDR). The CDR Update is a companion document to the CDR, and it describes the collaboration's progress since the CDR was submitted in January 1993. Therefore, this document concentrates on changes, refinements, and decisions that have been made over the past year. These documents together define the baseline PHENIX detector that the collaboration intends to build for operation at RHIC startup. In this chapter the current status of the detector and its motivation are briefly described. In Chapters 2 and 3 the detector and the physics performance are more fully developed. In Chapters 4 through 13 the details of the present design status, the technology choices, and the construction costs and schedules are presented. The physics goals of PHENIX collaboration have remained exactly as they were described in the CDR. Primary among these is the detection of a new phase of matter, the quark-gluon plasma (QGP), and the measurement of its properties. The PHENIX experiment will measure many of the best potential QGP signatures to see if any or all of these physics variables show anomalies simultaneously due to the formation of the QGP.

6679 (DESY–94-126) **Compact lattice QED with staggered fermions and chiral symmetry breaking.** Hoferichter, A. (Humboldt-Universitaet, Berlin (Germany). Sektion 3 - Fachbereich Physik); Mitrjushkin, V.K.; Mueller-Preussker, M. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 14p. Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). Grant DFG Mu 932/1-2. (HU-Berlin-IEP–94/11; HEP-LAT–9407009). Order Number DE95725955. Source: OSTI; NTIS (US Sales Only); INIS.

Different formulations of the 4d compact lattice QED with staggered fermions (standard Wilson and modified by suppression of lattice artifacts) are investigated by Monte Carlo simulations within the quenched approximation. We show that after suppressing lattice artifacts the system undergoes a phase transition from the Coulomb phase into a presumably weakly chirally broken phase only at (unphysical) negative β-values. (orig.)

6680 (DESY–94-129) **Transition from $SU(2)_L xSU(2)_R xU(1)_{B-L}$ representation to $SU(2)_L xU(1)_Y$ by q-deformation and the corresponding classical breaking term of chiral U(2).** Boenisch, R. (Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). inst. fuer Hochenergiephysik). Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Jul 1994. 15p. (HEP-TH–9407162). Order Number DE95725965. Source: OSTI; NTIS (US Sales Only); INIS.

The minimal Standard Model exhibits a nontrivial chiral U(2) symmetry if the VEV and the hypercharge splitting $\Delta=(y_R{}^u-y_R{}^d)/2$ of right-handed leptons (quarks) in a family vanish and $Q=T_0+Y$ independently in each helicity sector. As a generalization, we start with $SU(2)_L xSU(2)_R xU(1)_{(B-L)}$ and introduce Δ as a continuous parameter which is a measure of explicit symmetry breakdown. Values $0\leq\Delta\leq 1/2$ take the neutral generator of the isospin-1/2 representation to the singlet representation, i.e. 'deformes' the LR representation into the minimal Standard one. The corresponding classical O(3)-breaking term is a magnetic field perpendicular to the x_3-axis. A simple mapping on the fundamental Drinfeld-Jimbo q-deformed SU(2) representation is given. (orig.)

6681 (DESY–94-134) **Reggeon interactions in perturbative QCD.** Kirschner, R. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Aug 1994. 15p. Order Number DE95725966. Source: OSTI; NTIS (US Sales Only); INIS.

We study the pairwise interaction of reggeized gluons and quarks in the Regge limit of perturbative QCD. The interactions are represented as integral kernels in the transverse momentum space and as operators in the impact parameter space. We observe conformal symmetry and holomorphic factorization in all cases. (orig.)

6682 (DESY–94-142) **The geometric Schwinger Model on the Torus II.** Joos, H. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Azakov, S.I. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 27p. Order Number DE95725661. Source: OSTI; NTIS (US Sales Only); INIS.

The geometric Schwinger Model (gSM) is the theory of a U(1)-gauge field in two dimensions coupled to a massless Dirac Kaehler field. It is equivalent to a Schwinger model with Dirac fields $\Phi_a{}^b(x)$ carrying iso-spin 1/2. We consider this model on the Euclidean space time of a torus. In Part I we discussed in detail the zero mode structure of this model. The main aim of this Part is the calculation of the correlation functions of currents and densities. Since it turned out that the gSM illustrates the generally interesting structure of anomalous chiral symmetry breaking in a very transparent manner, we present our results in the more familiar language of Dirac fields. In the introduction to the first part of our investigations we mentioned as motivation for the study of the gSM on the torus the possibility of a systematic lattice approximation of this model. In the meanwhile this project was realized to a large extend. Here we give the details of the discussion of the different quantities in the continuum to which we applied the lattice approximation. For these we formulate the 'geometric' description by differential forms of quantities which we consider interesting in this context. (orig.)

6683 (DESY–94-151) **Compact lattice QED with Wilson fermions.** Hoferichter, A. (Humboldt-Universitaet, Berlin (Germany). Sektion 3 - Fachbereich Physik); Mitrjushkin, V.K.; Mueller-Preussker, M.; Neuhaus, T.; Stueben, H. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 32p. Sponsored by Deutsche Forschungsgemeinschaft, Bonn (Germany). (HU-Berlin-IEP–94/13). Order Number DE95725564. Source: OSTI; NTIS (US Sales Only); INIS.

We study the phase structure and the chiral limit of 4d compact lattice QED with Wilson fermions (both dynamical and quenched). We use the standard Wilson gauge action and also a modified one suppressing lattice artifacts. Different techniques and observables to locate the chiral limit are discussed. (orig.)

6684 (DOE/ER/40448–T1) **Theoretical aspects of electroweak and other interactions in medium energy nuclear physics. Interim progress report.** Mukhopadhyay, N.C. Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Physics. 5 Dec 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER40448. Order Number DE95004341. Source: OSTI; NTIS; INIS; GPO Dep.

Significant progress has been made in the current project year in the development of chiral soliton model and its applications to the electroweak structure of the nucleon and the Delta (1232) resonance. Further progress also has been made in the application of the perturbative QCD (pQCD) and the study of physics beyond the standard model. The postdoctoral associate and the graduate student working towards his Ph.D. degree have both made good progress. The review panel of the DOE has rated this program as a "strong, high priority" one. A total of fifteen research communications – eight journal papers and, conference reports and seven other communications – have been made during the project year so far. The principal investigator is a member of the Physics Advisory Committee of two nuclear accelerator facilities.

6685 (DOE/ER/40561–168) **Neutrino oscillations from discrete non-Abelian family symmetries.** Schmaltz, M. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE95004355. Source: OSTI; NTIS; INIS; GPO Dep.

The author discusses a SUSY-GUT model with a non-Abelian discrete family symmetry that explains the observed hierarchical pattern of quark and lepton masses. This SO(10) $\times$ $\Delta(75)$ model predicts modified quadratic seesaw neutrino masses and mixing angles which are interesting for three reasons: (1) they offer a solution to the solar neutrino problem, (2) the tau neutrino has the right mass for a cosmologically interesting hot dark matter candidate, and (3) they suggest a positive result for the $\nu_\mu \rightarrow \nu_\tau$ oscillation searches by the CHORUS and NOMAD collaborations. However, the model shares some problems with many other predictive GUT models of quark and lepton masses. Well-known and once successful mass and angle relations, such as the SU(5) relation $\lambda_b{}^{GUT} = \lambda_l{}^{GUT}$, are found to be in conflict with the current experimental status. Attempts to correct these relations seem to lead to rather contrived models.

6686 (INS–1059) **Pion-nucleon and kaon-nucleon scattering lengths in QCD sum rules.** Kondo, Y.; Morimatsu, O.; Nishino, Y. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1994. 15p. Order Number DE95737278. Source: OSTI; NTIS; INIS.

The pion-nucleon and kaon-nucleon scattering lengths are studied in the QCD sum rule. We show that the leading and next-to-leading order terms of OPE give rise to the Tomozawa-Weinberg and sigma terms, respectively. We also show that in the kaon-nucleon system the $\Lambda(1405)$ contribution has to be subtracted from the OPE side in order to obtain the scattering length. The odd components of the T-matrices are in agreement with the experimental values not only in the pion-nucleon channel but also in the kaon-nucleon channel after the $\Lambda(1405)$ contribution subtracted. The even components disagree with the experimental values in the pion-nucleon channel, which is similar to the situation in the PCAC-plus-current-algebra approach at the Weinberg point. We speculate

that this discrepancy should be explained by the continuum contribution in the spectral function above the pion-nucleon threshold. (author).

6687 (LBL–34831, pp. 1-39) **Relativistic heavy ion collisions: "Re-creating" the early universe in the laboratory.** Mueller, B. (Duke Univ., Durham, NC (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract FG05-90ER40592. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Central nuclear collisions at energies of many GeV/nucleon may provide for conditions similar to those in the early universe during the first few microseconds, where the transition from highly excited hadronic matter into quark matter or quark-gluon plasma can be probed. Here, the author reviews the current understanding of the physical properties of a quark-gluon plasma and reviews ideas about the nature of, and signals for, the deconfinement transition. The author also discusses recent progress in the treatment of the formation of a thermalized state at the QCD parton level.

6688 (LBL–34831, pp. 73-85) **Gluon multiplication in high energy heavy ion collisions.** Xiong, Li (State Univ. of New York, Stony Brook, NY (United States)); Shuryak, E. Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract FG02-88ER40388. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Hot gluons are the dominant components of the QCD plasma to be formed in future high energy heavy ion experiments. In this work, the authors study the elementary processes in the plasma medium for gluon multiplication based on all orders of the three-diagrams in perturbative QCD. When applying to the chemical equilibration in the expanding system, they found that the gluons reach chemical equilibrium well within its plasma phase. The inclusion of all the next-to-leading order processes makes the equilibration considerably faster than the simply gg $\leftrightarrow$ ggg one considered previously.

6689 (LBL–34831, pp. 87-98) **Time evolution of the quark-gluon plasma.** Cooper, F. (Los Alamos National Lab., NM (United States)); Kluger, Y.; Dawson, J.; Shepard, H. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors derive the renormalized time evolution equations for the production and time evolution of an SU(2) Yang Mills Plasma from a neutral semi-classical Yang-Mills Field. They show that in a background Feynman gauge that the ghost degrees of freedom cancel the unphysical modes of the Yang-Mills field in the induced current that controls the back-reaction on the initial semi-classical neutral field. This model is a prototype for the production of the non-abelian gluon plasma following a Relativistic Heavy Ion collision. The non-abelian nature determines the renormalization properties of the back-reaction equation and displays the asymptotic freedom property of the Yang-Mills field.

6690 (LBL–34831, pp. 99-111) **Transport equations embodying particle production and back-reaction.** Eisenberg, J.M. (TRIUMF, Vancouver (Canada)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

A brief summary is presented of studies of systems in which pairs are produced in a strong electric field, are accelerated by it, and then react back on it through the counter-field produced by their current. This picture has often been used in phenomenological treatments of effects that may arise in the quark-gluon plasma (QGP). Here the field formulation of the problem is sketched for charged bosons, requiring a renormalization program which is outlined very briefly. A phenomenological transport equation is presented that embodies physics essentially identical to that of the field formulation. Numerical results are shown to substantiate this claim, and the corresponding physical behavior of the system is discussed. Extensions are noted to the fermion case, to the formulation in terms of boost-invariant variables (needed for the QGP), and to the formal derivation of the transport equations. The presentation here stresses the development of a practicable calculational scheme for eventual use in studies of the QGP. In that spirit, work in progress on the study of more realistic conditions-namely, non-classical (electric) fields, non-Abelian fields, and spatial dependence is noted.

6691 (LBL–34831, pp. 113-124) **QCD transport theory.** Heinz, U. (Univ. of California, Santa Barbara, CA (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. Grant PHY89-04035. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The author reviews recent progress in the development of a transport theory for quarks and gluons and in the understanding of the transport properties of a quark-gluon plasma.

6692 (LBL–34831, pp. 125-136) **Transport properties of quark and gluon plasmas.** Heiselberg, H. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract AC03-76SF00098. Grant PHY89-21025; Grant PHY91-00283; Grant NAGW-1583. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The kinetic properties of relativistic quark-gluon and electron-photon plasmas are described in the weak coupling limit. The troublesome Rutherford divergence at small scattering angles is screened by Debye screening for the longitudinal or electric part of the interactions. The transverse or magnetic part of the interactions is effectively screened by Landau damping of the virtual photons and gluons transferred in the QED and QCD interactions respectively. Including screening a number of transport coefficients for QCD and QED plasmas can be calculated to leading order in the interaction strength, including rates of momentum and thermal relaxation, electrical conductivity, viscosities, flavor and spin diffusion of both high temperature and degenerate plasmas. Damping of quarks and gluons as well as color diffusion in quark-gluon plasmas is, however, shown not to be sufficiently screened and the rates depends on an infrared cut-off of order the "magnetic mass," $m_{mag} \sim g^2T$.

6693 (LBL–34831, pp. 137-150) **Color collective effects at the early stage of ultrarelativistic heavy-ion collisions.** Mrowczynski, S. (Soltan Institute for Nuclear Studies, Warsaw (Poland)). Lawrence Berkeley Lab., CA (United States). [1993]. Grant 20436-91-01. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Hard and semihard processes lead to a copious production of partons at the early stage of ultrarelativistic heavy-ion collisions. Since the parton momentum distribution is strongly anisotropic the system can be unstable with respect to the specific plasma modes. The conditions of instability are found and the characteristic time of its development is estimated. Then, the screening of the static chromoelectric field in the nonequilibrium plasma is studied. Importance of the two phenomena for heavy-ion collisions at RHIC and LHC is critically discussed.

6694 (LBL–34831, pp. 151-158) **Collective non-abelian phenomena in quark gluon plasma.** Parikh, J.C. (Physical Research Lab., Ahmedabad (India)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Some specific aspects of production and evolution of quark gluon plasma are discussed. For A - A collisions, $q\bar{q}$ pair production in the color flux tube model is determined, in the presence of an oscillating color field. Thermalization of the plasma due to its

chaotic behavior is examined in a (1+1)-dimension particle simulation code.

6695 (LBL–34831, pp. 159-170) **Color diffusion in QCD transport theory.** Selikhov, A.V. (Columbia Univ., New York, NY (United States)); Gyulassy, M. Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract FG02-93ER40764. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Color diffusion is shown to be an important dissipative property of quark-gluon plasmas with the characteristic color relaxation time scale, $t_c \sim (3\alpha_s T \log (m_E/m_M))^{-1}$, showing its sensitivity to the ratio of the static color electric and magnetic screening masses. Fokker-Planck equations are derived for QCD Wigner distributions taking into account quantum color dynamics. These equations show that the anomalously small color relaxation time leads to a small color conductivity and to strong damping of collective color modes.

6696 (LBL–34831, pp. 171-182) **Parton interaction rates and limits of perturbative QCD.** Thoma, M.H. (Universitaet Giessen (Germany)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The relevance of parton interaction rates for observables of a quark-gluon plasma and for testing field theoretical methods is exhibited. Using the Braaten-Pisarski method the interaction rate as well as the transport rate beyond the leading logarithm approximation are estimated. Limits on the validity of perturbative QCD for relativistic heavy ion collisions are discussed.

6697 (LBL–34831, pp. 183-196) **Influence of the Landau-Pomeranchuk effect on lepton-pair production.** Cleymans, J. (Univ. of Cape Town, Rondebosch (South Africa)); Goloviznin, V.V.; Redlich, K. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

An estimate is made of the Landau-Pomeranchuk effect on the production of dileptons in a hadronic gas and in a quark-gluon plasma. For low mass dilepton pairs this effect reduces the production rate for bremsstrahlung by an order of magnitude. For high invariant masses its influence is negligible. This behaviour is of importance for the theoretical analysis of low mass dilepton pairs produced in relativistic heavy ion collisions.

6698 (LBL–34831, pp. 197-206) **Classical and quantum coherence in bremsstrahlung.** Knoll, J. (Gesellschaft fuer Schwerionenforschung (GSI), Darmstadt (Germany)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Recent considerations about the importance of coherence effects for bremsstrahlung in dense matter (Landau-Pomerancuk-Migdal-effect) are presented and extended for the application to QCD transport and parton kinetic models. Low energy (soft limit) theorems are discussed and pocket correction formulae for the in-matter radiation cross sections are derived using the experience from an exactly solvable hard-scattering model. In contrast to recent derivations by others the author requires a stronger in-medium suppression factor of the form $(\omega\tau)^4/(1+(\omega\tau)^2)^2$ where ω is the energy of the radiated quantum and τ is the mean free time between successive collisions. This stronger suppression of e.g. gluon radiation implies an even weaker stopping power of high energy partons than discussed by Wang and Gyulassy.

6699 (LBL–34831, pp. 207-218) **Medium effects on heavy-ion dynamics.** Ko, Che Ming (Texas A&M Univ., College Station, TX (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. Grant PHY-9212209. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The property of hadrons in hot dense matter is reviewed. Incorporating the medium effects in the relativistic transport model, which consistently treats the change of hadron masses and energies in dense matter via the scalar and vector fields, the expansion stage of heavy-ion collisions at the AGS and CERN energies is studied. With the in-medium particle production cross sections, this model provides a plausible explanation for the observed enhancement of strange particle production and differences in the slope parameters of the kinetic energy spectra for particles and antiparticles.

6700 (LBL–34831, pp. 219-233) **Landau-Pomeranchuk effect in QCD and radiative energy loss.** Wang, Xin-Nian (Lawrence Berkeley Lab., CA (United States)); Gyulassy, M. Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract FG02-93ER40764 ; AC03-76SF00098. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Landau-Pomeranchuk effect, the suppression of soft bremsstrahlung due to multiple scatterings inside a dense medium, is investigated in perturbative QCD. An effective formation time of the radiation due to the color interference is obtained which depends on the color representation of the propagating jet parton. Using this effective formation time, the radiative energy loss is obtained which interpolates nicely between the factorization and Bethe-Heitler limits.

6701 (LBL–34831, pp. 243-256) **Quark-gluon plasma freeze-out from a supercooled state?.** Csoergo, T. (KFKI RMKI, Budapest (Hungary)); Csernai, L.P. Lawrence Berkeley Lab., CA (United States). [1993]. Grant NFR/NAVF-422.93/008; Grant NFR/NAVF-422.93/011; Grant OTKA (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors consider time-scales of first-order deconfinement or chiral-symmetry restoring phase transition in high energy heavy ion collisions at RHIC and LHC energies. Recently, it was shown that the system must supercool below T_c before the nucleation of hadronic bubbles is sufficiently rapid to overcome the expansion rate. It is shown here that the expected time-scales of high energy heavy ion reactions are sufficiently short to prevent the reheating of the system to near T_c. If quark-gluon plasma is produced in these collisions, it may have to hadronize from a supercooled state and the hadrons produced during rehadronization may freeze-out almost immediately.

6702 (LBL–34831, pp. 257-263) **Effective action of a QCD chiral order parameter.** Elze, H.T. (CERN-Theory, Geneva (Switzerland)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

Density fluctuations in small phase space bins for centrally produced particles (mainly pions) are conveniently parametrized by a Gaussian free energy functional of the density fluctuation field. This observation leads to the investigation of the O(N) linear σ-model; the O(4) version may represent the QCD chiral order parameter in the case of two approximately massless quark flavours. The author derives a non-perturbative and finite equation for its finite temperature effective action in terms of scalar and pseudo-scalar iso-vector (meson) fields. In the large-N limit, well-known results on the nature of the phase transition are recovered. Thus, one obtains the Ginzburg-Landau theory for a QCD system in thermodynamic equilibrium.

6703 (LBL–34831, pp. 265-281) **Soft interaction, intermittency and phase transition.** Hwa, R.C. (Univ. of Oregon, Eugene, OR (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. DOE Contract FG06-91ER40637. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The importance of understanding soft interaction is discussed. It is shown how the Geometrical Branching Model can reproduce all

the low-p_T data on hadronic collisions, including fluctuations. Arguments are given on why intermittency data on nuclear collisions can reveal signatures of collective behavior. Scaling properties of hadronic observables when a quark-gluon plasma undergoes a phase transition are shown to possess a universal feature independent of unknown details of the system. The problem of cluster growth is also considered, and the possibility of a novel signature of quark-gluon plasma is suggested.

6704 (LBL–34831, pp. 283-292) **Non-perturbative effects in the SU(3)-gluon plasma.** Rischke, D.H. (Institut fuer Theoretische Physik der Universitaet, Frankfurt (Germany)); Gorenstein, M.I.; Schaefer, A.; Stoecker, H.; Greiner, W. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors investigate lattice data for the thermodynamical functions of the SU(3) pure gauge theory and propose a phenomenological equation of state which is able to reproduce these data. Their results suggest that even at high temperatures only gluons with large momenta are deconfined, while gluons with small momenta cluster into glueball states. Therefore, the gluon plasma is not an ideal gas of gluons, but rather a "gluon-cluster" plasma.

6705 (LBL–34831, pp. 293-304) **Colour confinement in hadron-nucleus collisions.** Kharzeev, D. (Moscow State Univ. (Russian Federation)); Satz, H. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors study the evolution of colour confinement in hadron-nucleus collisions and determine the resulting x_F dependence for the suppression of quarkonium production on nuclear targets. The Landau-Pomeranchuk effect applied to colour bremsstrahlung is shown to play a considerable role in the form of the suppression.

6706 (LBL–34831, pp. 305-312) **Modelling coherence and chaos in high-energy collisions.** Wilk, G. (Soltan Institute for Nuclear Studies, Warsaw (Poland)); Wlodarczyk, Z.; Weiner, R.M. Lawrence Berkeley Lab., CA (United States). [1993]. Grant 2-0957-91-01; Grant 2-0423-91-01. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The quantum statistical concepts of coherence and chaos used to describe fluctuations in multiparticle production processes are incorporated in a generalized Monte Carlo version of the Interacting Gluon Model (IGM). The two components in the multiplicity distributions found previously are identified as originating from the two components of the energy flow existing in the IGM: the one provided by the interacting gluons and the other related to the initial valence quarks of the projectiles.

6707 (LBL–34831, pp. 321-328) **Bose-condensates in high energy nucleus-nucleus collisions.** Ornik, U. (Theory Group, Darmstadt (Germany)); Pluemer, M.; Strottman, D. Lawrence Berkeley Lab., CA (United States). [1993]. Grant 06MR731. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The conditions necessary for the formation of a superfluid component in an expanding system of excited matter created in nuclear collisions are investigated. For a realistic resonance gas equation of state, it is found that the decoupling from local chemical equilibrium must occur at high temperatures and baryon number densities for a sizable amount of condensate to be formed.

6708 (SLAC-PUB–6618) **Studies of strong electroweak symmetry breaking at future e^+e^- linear colliders.** Barklow, T.L. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-940816–53: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004281. Source: OSTI; NTIS; INIS; GPO Dep.

Methods of studying strong electroweak symmetry breaking at future e^+e^- linear colliders are reviewed. Specifically, we review precision measurements of triple gauge boson vertex parameters and the rescattering of longitudinal W bosons in the process $e^+e^- \rightarrow W^+W^-$. Quantitative estimates of the sensitivity of each technique to strong electroweak symmetry breaking are included.

6709 (ANL-HEP-CP–94-66) **Polarization and N-N elastic scattering amplitudes.** Ramsey, G.P. (Loyola Univ., Chicago, IL (United States). Dept. of Physics). Argonne National Lab., IL (United States). 7 Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409103–9: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95004648. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss the role of polarization measurements and scattering amplitudes for elastic nucleon-nucleon processes at high energy. The relative normalization of these amplitudes involves a "leading order form factor" which we determine empirically. These amplitudes provide an economical description of a large body of existing data and make some nontrivial predictions for spin observables. In particular, we have investigated cross sections and asymmetry data at large angles (including 90° c.m.) and the fixed $|t|$, large s region, dominated by the three-gluon exchange mechanism. Our results indicate that polarization experiments can test basic QCD elements such as helicity conservation, wave function properties and the interplay between various interaction mechanisms. The significance of this analysis will be discussed in terms of specific polarization experiments, which can be performed at Fermilab and Brookhaven (RHIC.AGS).

6710 (ANL-HEP-TR–94-60) **High Energy Physics Division semiannual report of research activities, January 1, 1994–June 30, 1994.** Argonne National Lab., IL (United States). Sep 1994. 72p. This report describes the research conducted in the High Energy Physics Division of Argonne National Laboratory during the period of January 1, 1994-June 30, 1994. Topics covered here include experimental and theoretical particle physics, advanced accelerator physics, detector development, and experimental facilities research. Lists of division publications and colloquia are included.

6711 (DESY–93-016) **Rare B-decays in the standard model.** Ali, A. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Greub, C.; Mannel, T. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Feb 1993. 36p. (ZU-TH–4/93; IKDA–93/5). Order Number DE95733431. Source: OSTI; NTIS (US Sales Only); INIS.

We review theoretical work done in studies of the Flavour Changing Neutral Current (FCNC) B-decays in the context of the Standard Model. Making use of the QCD-improved effective Hamiltonian describing the so-called vertical stroke ΔBvertical stroke =1 and vertical stroke ΔBvertical stroke =2, vertical stroke ΔQvertical stroke =0 transitions, we calculate the rates and differential distributions in a large number of B-decays. The FCNC processes discussed here include the radiative decays $B \rightarrow X_s + \gamma$, $B \rightarrow X_d + \gamma$, and the semileptonic decays $B \rightarrow X_s l^+l^-$, $B \rightarrow X_d l^+l^-$, $B \rightarrow X_s \nu_l$ anti ν_l, and $B \rightarrow X_d \nu_l$ anti ν_l. We also discuss the inclusive photon energy spectrum calculated from the Charged Current (CC) decays $B \rightarrow X_c + \gamma$ and $B \rightarrow X_u + \gamma$ and the mentioned FCNC radiative decays. The importance of carrying out measurements of the inclusive photon energy spectrum in B-decays is emphasized. Using phenomenological potential models and the Heavy Quark Effective Theory (HQET) we estimate decay branching ratios in a number of exclusive FCNC B-decays. Purely leptonic and photonic

decays (B_d, B_s) → l^+l^- and (B_d, B_s) → $\gamma\gamma$ are also estimated. The principal interest in the studies of FCNC B-decays lies in their use in determining the parameters of the standard Model, in particular the CKM matrix elements and the top quark mass. The parametric dependence of these and other QCD-specific parameters on the rates and distributions is worked out numerically. (orig.)

6712 (DESY–94-077) **τ- μ- e universality in τdecays and constraints on the slepton masses.** Chankowski, P.H. (Istituto Nazionale di Fisica Nucleare, Padua (Italy)); Hempfling, R.; Pokorksi, S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). May 1994. 17p. (DFPD–94/TH-27; MPI-PhE–94-28; HEP-PH–9405281). Order Number DE95725967. Source: OSTI; NTIS (US Sales Only); INIS.

The leptonic τ decays are calculated at the 1-loop level in the Minimal Supersymmetric Standard Model. The deviation from the τ-μ-e universality is studied as a function of the supersymmetric parameters and discussed in the context of the expected improvement of the experimental accuracy. (orig.)

6713 (DESY–94-114) **BFKL versus O(α^3_s) corrections to large-rapidity dijet production.** Del Duca, V. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany)); Schmidt, C.R. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 25p. (SCIPP–94/17; HEP-PH–9407359). Order Number DE95725968. Source: OSTI; NTIS (US Sales Only); INIS.

We examine dijet production at large rapidity intervals at Tevatron energies by comparing an exact OMIKRON (α_s^3) calculation with the BFKL approximation, which resums the leading powers of the rapidity interval y to all orders in α_s. We analyze the dependence of the exact OMIKRON (α_s^3) calculation on the jet cone-size as a function of y, and use this cross section to define an 'effective rapidity' y which reduces the error that the large-y approximation induces on the kinematics. Using y in the BFKL resummation, we reexamine jet production at large transverse momenta and the transverse momentum decorrelation of the tagging jets. We find less dramatic, but still significant, effects than found previously using the large-y approximation. (orig.)

6714 (DESY–94-120) **Determination of the structure of τdecays in the reaction $e^+e^- \to \tau^+\tau^- \to \rho^+$ anti $\nu_\tau\rho^-\nu_\tau$ and a precision measurement of the τ-neutrino helicity.** Albrecht, H.; Hamacher, T.; Hofmann, R.P.; Kirchhoff, T.; Mankel, R.; Nau, A.; Nowak, S.; Ressing, D.; Schroeder, H.; Schulz, H.D.; Walter, M.; Wurth, R.; Hast, C.; Kapitza, H.; Kolanoski, H.; Kosche, A.; Lange, A.; Lindner, A.; Schieber, M.; Siegmund, T.;ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 14p. Order Number DE95725959. Source: OSTI; NTIS (US Sales Only); INIS.

Using the ARGUS detector at the DORIS II storage ring we have investigated the Lorentz structure of the electroweak interaction in semi-hadronic τ decays. Spin correlations in the process $e^+e^- \to \tau^+\tau^- \to$ anti $\nu_\tau\pi^+\pi^0$ $\nu_\tau\pi^-\pi^0$ are exploited for a measurement of the normalized product of the vector (g_V) and axial vector (g_A) couplings of the τ lepton, γ_{AV}=2 Re{$g_A g_V^*$}/(vertical stroke $g_V$vertical stroke ^{2}+vertical stroke $g_A$vertical stroke ^{2}). The correlations are sensitive to the product of the couplings in both τ decays: $\gamma_{AV}{}^2=\gamma_{AV}(\tau^- \to \nu_\tau W^-)\gamma_{AV}(\tau^+ \to$ anti $\nu_\tau W^+)$, which can be interpreted as the product of the neutrino helicities: $\gamma_{AV}{}^2$=-h(ν_τ)h(anti ν_τ). The measured value, $\gamma_{AV}{}^2$=1.044±0.057±0.060, determines the relative sign of the neutrino helicities. Assuming CP invariance, the absolute value {γ_{AV}}=1.022±0.028±0.030 was found to be in excellent agreement with the Standard Model. The contribution of scalar (g_S) or pseudoscalar (g_P) couplings was also investigated. No evidence for a scalar-like coupling was found. (orig.)

6715 (DESY–94-124) **Next-to-leading order fragmentation functions for pions and kaons.** Binnewies, J. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Kniehl, B.A.; Kramer, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 35p. Order Number DE95725958. Source: OSTI; NTIS (US Sales Only); INIS.

We present new sets of fragmentation functions for charged pions and kaons, both at leading and next-to-leading order. They are fitted to TPC data taken at energy $\sqrt{s}$=29 GeV and describe excellently a wealth of other e^+e^- data on charged-hadron production, ranging from $\sqrt{s}$=5.2 GeV way up to LEP 1 energy. They also agree with data on the production of neutral pions and kaons, if one makes the natural assumption that the respective fragmentation functions are related to the charged counterparts by SU(2) symmetry. We also list simple parameterizations of the x and Q^2 dependence of our results, which may be implemented conveniently in applications. (orig.)

6716 (DESY–94-125) **SMATASY. A Program for the model independent description of the Z resonance.** Kirsch, S.; Riemann, T. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Jul 1994. 26p. Order Number DE95725960. Source: OSTI; NTIS (US Sales Only); INIS.

SMATASY is an interface for the $_{ZF}I^TT_{ER}$ package and may be used for the model independent description of the Z resonance at LEP 1 and SLC. It allows the determination of the Z mass and width and its resonance shape parameters r and j for cross-sections and their asymmetries. The r describes the peak height and j the interference of the Z resonance with photon exchange in each scattering channel and for σ_T, σ_{FB}, σ_{lr}, σ_{pol} etc. separately. Alternatively, the helicity amplitudes for a given scattering channel may be determined. We compare our formalism with other model independent approaches. The model independent treatment of QED corrections in SMATASY is applicable also far away from the Z peak. (orig.)

6717 (DESY–94-127) **Signals for supersymmetry at HERA.** Dreiner, H. (Eidgenoessische Technische Hochschule, Zurich (Switzerland). Inst. fuer Theoretische Physik); Morawitz, P. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 36p. Order Number DE95725665. Source: OSTI; NTIS (US Sales Only); INIS.

We consider the baryon parity signals at HERA for the case of the MSSM production mechanisms and the decays via the lepton number violating couplings L_iQ anti D. We can probe very small Yukawa couplings $\lambda'>$ or $\approx 3.10^{-6}$, limited only by the decay length of the LSP. We assume the LSP to be the lightest neutralino and study its decays in detail. We present the matrix element squared for the tree-level decay amplitude of a generally mixed neutralino explicitly. We find that the branching fraction to charged leptons strongly depends on the SUSY parameters and can differ significantly from the naively expected 50%. The SUSY mass reaches of the studied processes in the ZEUS detector at HERA were found to be: (m(e, anti ν)+m(anti q)) $\leq$ 170 GeV, 195 GeV and 205 GeV for the L_1Q anti D, $L_\mu Q$ anti $\overline{D}$ and $L_\bullet Q$ anti D couplings respectively. These are well above existing limits on R-parity violating (R_p) SUSY from previous experiments. We conclude that HERA offers a very promising discovery potential for R_p SUSY. (orig.)

6718 (DESY–94-131) **Recombination effects in the structure function evolution at low x. Can they be observed at HERA?.** Golec-Biernat, K. (Institute of Nuclear Physics, Cracow (Poland)); Krasny, M.W.; Riess, S. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Jul 1994. 12p. Order Number DE95725957. Source: OSTI; NTIS (US Sales Only); INIS.

Can the non-linear QCD effects resulting from parton recombination be detected at HERA by the H1 and ZEUS detectors? We argue that an extension of the low x domain of the proton structure function F_2 measurements to small electron scattering angle is essential before they can be ruled out. If, on the other hand, they are large, we find that their magnitude cannot be determined unambiguously from the measured Q^2 and x dependence of F_2. This is due to large correlations between the size of recombination effects and the gluon distribution which is very weakly constrained at low x by the F_2 evolution. (orig.)

6719 (DESY–94-136) **Inclusive photoproduction of hadrons at HERA. - Direct photon production at LEP and HERA.** Kniehl, B.A. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Kramer, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 19p. (CONF-9405266–: Workshop on two-photon physics at LEP and HERA: status of data and models, Lund (Sweden), 26-28 May 1994). Order Number DE95725663. Source: OSTI; NTIS (US Sales Only); INIS.

Matrix element calculations for the decay of the Z into one isolated photon plus n jets are reviewed. The problem of photon

isolation with respect to quark, antiquark and gluon is discussed in detail. Experimental results of the LEP collaborations are compared to the theory. Theoretical results for γ+n jet production in deep inelastic ep collisions at HERA are presented also. (orig.)

6720 (DESY–94-138) **A search for heavy leptons at HERA.** Ahmed, T.; Aid, S.; Andreev, V.; Andrieu, B.; Appuhn, R.D.; Arpagaus, M.; Babaev, A.; Baehr, J.; Ban, J.; Baranov, P.; Barrelet, E.; Bartel, W.; Barth, M.; Bassler, U.; Beck, H.P.; Behrend, H.J.; Belousov, A.; Berger, C.; Bergstein, H.; Bernardi, G.; BerneH1 Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 19p. Order Number DE95732221. Source: OSTI; NTIS (US Sales Only); INIS.

A search for direct production of new leptons in the mass range from 10 GeV up to 225 GeV is presented by the H1 experiment at HERA. The data were obtained during 1993 and correspond to an integrated luminosity of 528 nb^{-1}. The search includes heavy lepton decays to final states $e(\nu)\gamma$ and $e(\nu)W$, $e(\nu)Z$ with the subsequent decay of the W and Z bosons into jets or lepton pairs. No evidence was found for the production of new massive electrons or neutrinos in any of the decay channels. Rejection limits for excited electrons and neutrinos are derived. (orig.)

6721 (DESY–94-139) **Measurement of the polarization in the decay B $\rightarrow J/\psi K^*$.** Albrecht, H.; Hamacher, T.; Hofmann, R.P.; Kirchhoff, T.; Mankel, R.; Nau, A.; Nowak, S.; Ressing, D.; Schroeder, H.; Schulz, H.D.; Walter, M.; Wurth, R.; Hast, C.; Kapitza, H.; Kolanoski, H.; Kosche, A.; Lange, A.; Lindner, A.; Schieber, M.; Siegmund, T.;ARGUS Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 7p. Order Number DE95732177. Source: OSTI; NTIS (US Sales Only); INIS.

Polarization in the exclusive decay $B\rightarrow J/\psi K^*$ was measured using the ARGUS detector at the e^+e^- storage ring DORIS II. The ratio of the transverse to the total decay width was found to be $\Gamma_T/\Gamma=0.03\pm0.16\pm0.15$. This measurement demonstrates that the $B^0\rightarrow J/\psi K^{*0}$ decay channel can be effectively used for CP violation studies. (orig.)

6722 (DESY–94-140) **Diffractive photoproduction of jets with a direct pomeron coupling at HERA.** Kniehl, B.A. (Hamburg Univ. (Germany). 2. Inst. fuer Theoretische Physik); Kohrs, H.G.; Kramer, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 30p. (KEK-TH–407; KEK–94-77(prepr.); HEP-PH–9408340). Order Number DE95725659. Source: OSTI; NTIS (US Sales Only); INIS.

We investigate in detail the effect of a direct pomeron coupling to quarks on the production of jets in ep scattering with almost real photons. Jet production via a direct pomeron coupling is compared with the resolved-pomeron mechanism. We consider both direct and resolved photoproduction. Rapidity and transverse momentum distributions are calculated and compared with preliminary H1 and ZEUS data. (orig.)

6723 (DESY–94-144) **Leptoquark production at high energy e^+e^- colliders.** Bluemlein, J. (Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik); Boos, E. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Aug 1994. 15p. (CONF-9404210–: Zeuthen workshop on elementary particle theory: Physics at LEP200 and beyond, Teupitz (Germany), 10-15 Apr 1994). Order Number DE95725660. Source: OSTI; NTIS (US Sales Only); INIS.

The prospects to search for scalar and vector leptoquarks at high energy e^+e^- colliders are reviewed. We compare production cross sections in the energy range between $\sqrt{s}$=O(200 GeV) and 1 TeV for e^+e^- annihilation. QED and QCD corrections and the effect of beamstrahlung in these processes are discussed. For the case of linear colliders the search potential in the different possible collider modes as e^+e^- annihilation, $e^\pm\gamma$ scattering, and $\gamma\gamma$ fusion is compared. (orig.)

6724 (DESY–94-149) **Small x contributions to the structure function $F_L(x,Q^2)$.** Bluemlein, J. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Aug 1994. 5p. (CONF-9407135–: QCD 94: nuclear physics B, Montpellier (France), 7-13 Jul 1994; HEP-PH–9408377). Order Number DE95725567. Source: OSTI; NTIS (US Sales Only); INIS.

The gluon contributions to $F_L(x, Q^2)$ in $O(\alpha_s)$ are calculated taking into account the transverse momentum of the initial state parton. In comparison with collinear factorization $F_L(x, Q^2)$, is not affected at large x but takes smaller values in the small x range. The onset of the $k_\perp$ effect is a function of Q^2. (orig.)

6725 (DESY–94-153) **Photoproduction of J/ψmesons at HERA.** Ahmed, T.; Aid, S.; Andreev, V.; Andrieu, B.; Appuhn, R.D.; Arpagaus, M.; Babaev, A.; Baehr, J.; Ban, J.; Baranov, P.; Barrelet, E.; Bartel, W.; Barth, M.; Bassler, U.; Beck, H.P.; Behrend, H.J.; Belousov, A.; Berger, C.; Bergstein, H.; Bernardi, G.; BerneH1 Collaboration. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Aug 1994. 16p. Order Number DE95731948. Source: OSTI; NTIS (US Sales Only); INIS.

We present a study of J/ψ meson production in collisions of 26.7 GeV electrons with 820 GeV protons, performed with the H1-detector at the HERA collider at DESY. The J/ψ mesons are detected via their leptonic decays both to electrons and muons. Requiring exactly two particles in the detector, a cross section of $\sigma(ep\rightarrow J/\psi X)=(8.8\pm2.0\pm2.2)$ nb is determined for 30 GeV$\leq W_{\gamma p}\leq$180 GeV and $Q^2<$ or $\approx$4 GeV^2. Using the flux of quasi-real photons with $Q^2<$ or $\approx$4 GeV^2, a total photoproduction cross section of $\sigma(\gamma p\rightarrow J/\psi X)=(56\pm13\pm14)$ nb is derived at an average $W_{\gamma p}$=90 GeV. The distribution of the squared momentum transfer t from the proton to the J/ψ can be fitted using an exponential exp(-bvertical stroke tvertical stroke) below avertical stroke tvertical stroke of 0.75 GeV^2 yielding a slope parameter of $b=(4.7\pm1.9)$ GeV^{-2}. (orig.)

6726 (DESY–94-155) **Low x physics and perturbative Regge asymptotics.** Kirschner, R. Deutsches Elektronen-Synchrotron (DESY), Zeuthen (Germany). Inst. fuer Hochenergiephysik. Aug 1994. 17p. (CONF-9406273–: Tennessee international symposium on radiative corrections, Gatlinburg, TN (United States), 27 Jun - 1 jul 1994). Order Number DE95731933. Source: OSTI; NTIS (US Sales Only); INIS.

Deep-inelastic scattering at small x is a new field of QCD phenomenology which HERA experiments started to explore. The data show the feature expected by the perturbative Regge asymptotics. We describe the parton picture of structure function evolution both for increasing Q^2 and for decreasing x and discuss the leading logarithmic approximation of QCD on which this picture is based. The steep rise of the parton density towards smaller x gets saturated by parton recombination. An essential improvement of the leading logarithmic approximation has to be worked out in order to satisfy the unitarity conditions and in this way to describe the parton recombination in perturbative QCD. We review some ideas of the perturbative Regge asymptotics and some recent theoretical results about multi-reggeon exchange in QCD. (orig.)

6727 (DESY–94-178) **Deep inelastic structure functions from HERA.** Wolf, G. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany). Oct 1994. 20p. (CONF-9405216–: Neutrino '94: 16th international conference on neutrino physics and astrophysics, Eilat (Israel), 29 May - 3 jun 1994). Order Number DE95731368. Source: OSTI; NTIS (US Sales Only); INIS.

Results on deep inelastic scattering obtained by H1 and ZEUS from the 1993 data taken at HERA are presented. The measurements of the charged current process provide first evidence for the damping of the total neutrino cross section at high energies by the W propagator. A comparison with neutral current scattering shows that at Q^2 values above the W mass squared the weak cross section becomes comparable to the electromagnetic one. The structure function F_2 of the proton was determined from neutral current scattering data. The results confirm the steep rise of F_2 towards small x below 10^{-2} seen previously by the two experiments albeit with much less statistics. The rise persists from the lowest Q^2 values up to 500 GeV^2. The F_2 data are in accord with logarithmic scaling violations in a new regime of low x and high Q^2. An analysis of F_2 data by ZEUS in terms of the total virtual photon proton corss section shows $\sigma_{tot}(\gamma^*p)$ to increase with the total γ^*p c.m. energy, the increase being compatible with a linear rise. This

is in striking contrast with the behaviour of the total cross section for real photons or for anti pp scattering. (orig.)

6728 (DOE/ER/40310–T3) **Photon detector for MEGA. Final report, July 16, 1992–May 31, 1993.** Gagliardi, C.A.; Tribble, R.E. Texas A and M Univ., College Station, TX (United States). [1993]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40310. Order Number DE95003828. Source: OSTI; NTIS; INIS; GPO Dep.

During the past year, we have continued our work on the photon detector for the MEGA experiment at Los Alamos. The MEGA photon detector is designed to observe the 52.83 MeV photon produced in a $\pi \rightarrow e\gamma$ decay with an energy resolution of 1.25 MeV, a position resolution of 2×5 mm^2, a directional resolution of 10°, a time resolution of 500 ps, and an efficiency of about 5.4%. (All quoted resolutions are FWHM.) It consists of three independent concentric cylindrical pair spectrometers mounted within a 1.5 T magnetic field produced by a superconducting solenoid magnet. Each pair spectrometer includes two thin (0.045 radiation lengths each) Pb foils to convert photons into e^+e^- pairs. The two smaller pair spectrometers have three drift chamber layers to track the e^+e^- pairs and thereby determine both their locations and their vector momenta. The third pair spectrometer has four layers of drift chamber, together with a larger turning region, to provide better tracking information for high energy photons such as those from the $\pi^0 \rightarrow 2\gamma$ decay.

6729 (DOE/ER/40822–1) **[Accelerator physics R&D].** Krisch, A.D. Michigan Univ., Ann Arbor, MI (United States). 22 Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-94ER40822. Order Number DE95003624. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the NEPTUN-A experiment that will study spin effects in violent proton-proton collisions; the Siberian snake tests at IUCF cooler ring; polarized gas jets; and polarized proton acceleration to 1 TeV at Fermilab.

6730 (FNAL/C–94/289-E) **Search for new gauge bosons at Dv.** D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–63: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003745. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have searched for evidence of $W' \rightarrow e\nu$ and $Z' \rightarrow ee$ in data collected with the Dv detector at the Tevatron during the 1992–1993 $p\bar{p}$ collider run at $\sqrt{s} = 1.8$ TeV. They exclude the existence of a W′ of mass less than 600 GeV/c^2 and a Z′ of mass less than 480 GeV/c^2 at the 95% confidence level, assuming standard model couplings to quarks and leptons.

6731 (FNAL/C–94/294-E) **A search for $t\bar{t} \rightarrow$ lepton + E_T + jets signature in $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV with the D0 detector.** Chakraborty, D. (State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–65: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004239. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report the results from a search for $t\bar{t}$ production in $p\bar{p}$ collisions at $\sqrt{s} = 1.8$ TeV with the D0 detector at Fermilab in the final states consisting of one isolated high p_T lepton (e or μ), multiple jets and a substantial missing transverse energy (E_T), excluding the events that have μ-tagged jets. Two independent analysis approaches lead them to similar estimates for the cross-section. They see no conclusive evidence for top production in the 13.5 pb^{-1} of data taken during the 1992–1993 run of the Tevatron.

6732 (FNAL/C–94/306-E) **Electroweak boson pair production at the Tevatron.** Errede, S.M. (Univ. of Illinois, Urbana, IL (United States). Loomis Lab. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940722–35: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95004234. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results from CDF and Dv on $W\gamma$, $Z\gamma$ and WW, WZ, ZZ boson pair production in $\sqrt{s} = 1.8$ TeV $\bar{p}$-p collisions from the 1992–93 collider run are presented. Direct limits on CP-conserving and CP-violating $WW\gamma$, WWZ, $ZZ\gamma$ and $Z\gamma\gamma$ anomalous couplings have been obtained. The results are consistent with Standard Model expectations. In the static limit, the direct experimental limits on $WW\gamma$ and $ZZ\gamma$ anomalous couplings are related to bounds on the higher-order static (transition) EM moments of the W(Z) bosons. Expectations from the on-going and future Tevatron collider runs are discussed.

6733 (FNAL/C–94/329-E) **Measurement of the $WW\gamma$, $ZZ\gamma$ and $Z\gamma\gamma$ couplings at the Fermilab Tevatron.** Ellison, J. (California Univ., Riverside, CA (United States). Dept. of Physics). The D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–59: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003495. Source: OSTI; NTIS; INIS; GPO Dep.

The processes $p\bar{p} \rightarrow \ell\bar{\nu}_\gamma + X$ and $p\bar{p} \rightarrow \ell^+\ell^-_\gamma + X$ ($\ell = e, \mu$) have been observed using the DO detector at the Fermilab Tevatron Collider at $\sqrt{s} = 1.8$ TeV. The observed signals in the electron and muon decay channels are used as a probe of the $WW\gamma$, $ZZ\gamma$, and $Z\gamma\gamma$ vertex couplings. By comparing the event rates and shapes of the photon ET distributions with theoretical predictions, 95% confidence limits are obtained on the $WW\gamma$, $ZZ\gamma$, and $Z\gamma\gamma$ vertex coupling parameters.

6734 (FNAL/C–94/330-E) **A study of events with large total transverse energy produced in proton-antiproton collisions at $\sqrt{s} = 1.8$ TeV.** Piekarz, H. (Florida State Univ., Tallahassee, FL (United States)). Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940816–61: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95003382. Source: OSTI; NTIS; INIS; GPO Dep.

Properties of events originating from proton-antiproton interactions in which the total transverse energy, $\Sigma|E_T|$, of the event exceeded 400 GeV are presented. These events were produced at the Fermilab Tevatron Collider operating at a center-of-mass energy of 1.8 TeV and recorded in the D0 detector. The authors describe their analysis method which minimizes the effect of multiple interactions in the data sample. Based on a data sample of 5.45 ± 0.65 pb^{-1}, the topology of these hard scattering events as well as preliminary results for the cross-section, $d\sigma/d\Sigma|E_T|$, are presented and discussed.

6735 (FNAL/C–94/365-E) **Recent results from Fermilab E-687, charm particle decays, lifetimes and photoproduction dynamics: A compilation results presented at DPF 1994.** E687 Collaboration. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9409134–1: Conference on high energy physics: hadron structure, Kosice (Slovakia), 19-23 Sep 1994). Order Number DE95003748. Source: OSTI; NTIS; INIS; GPO Dep.

There is a vast theoretical and experimental support for idea that op quark as a weak isospin partner to b-quark should exist. Production cross section is steeply falling function of top quark mass. Therefore realistically at present only Tevatron $p\bar{p}$ collider at FNAL, with total energy 1.8 TeV in CMS system, still has a chance of top quark discovery. Dominant production mechanism for top quarks at Tevatron is pair production of $t\bar{t}$. With almost 100% probability t ($\bar{t}$) decays in mode $t \rightarrow W^+b$. Distinct features of this decay provide very good signatures of top quark production which helps to reduce otherwise very high level of background. Based on simple combinatorial arguments one can show that W should decay in 1/9 cases into $W \rightarrow l + \nu$ where l stands for lepton (e,μ,τ). Very clean signature represents case when both W's from t and $\bar{t}$ decay into e (μ) + ν. In this case experimental observation will be two isolated leptons characterized by large transverse momentum, large missing transverse energy E_T and 2 b quark jets. Jets originated from b quarks can be quite frequently recognized by presence of secondary vertices associated with jets. Another feature of b-jets which can be used for their identification is frequent association of so called soft leptons with jets. Two experimental setups CDF and D0 are able to take advantage of Tevatron for top quark discovery. Recently CDF collaboration presented evidence for direct observation of $t\bar{t}$ production in 19.3 pb^{-1} of $p\bar{p}$ collisions at $\sqrt{(s)}$ = 1.8TeV. Very brief account of these results is presented here.

6737 (GSI–94-55(prepr.)) **Prompt photon production in p-p collisions.** Cleymans, J. (Cape Town Univ. (South Africa). Dept. of Physics); Quack, E.; Redlich, K.; Srivastava, D.K. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Sep 1994. 35p. Order Number DE95725941. Source: OSTI; NTIS (US Sales Only); INIS.

A systematic study of the inclusive photon cross-section in p-p collisions is presented. The dependence of the γ rates on the renormalization and factorization scales is discussed. A comparison is made with experimental data for centre-of-mass energies ranging from 23 GeV to 1.8 TeV. Predictions of the cross-sections are given for two different sets of structure functions for RHIC and LHC energies. (orig.)

6738 (INIS-mf–14421, pp. 28-37) **Strangeness production experiments at SATURNE.** Ernst, J. (Bonn Univ. (Germany). Inst. fuer Strahlen- und Kernphysik). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

Results of three strangeness production experiments at SATURNE are presented using the high resolution magnetic spectrometer SPES4. In two experiments outgoing K^+ particles are detected at forward angles. The kaons were separated from an immense background of protons and pions by time-of-flight (TOF) and Cerenkov detectors. In the third experiment outgoing ^{3}He was measured and identified by TOF, only. The associated strangeness production in pp collisions was studied at bombarding energies of 2.3 and 2.7 GeV. The hyperon-nucleon missing mass spectra obtained show partly strong deviations from pure phase space which is ascribed to final state interactions of the pΛ and the NΣ systems. The structures found are discussed and compared with results from K^-d to π^-YN experiments, with theoretical calculations in the frame of one-boson-exchange (OBE) models, and with the prediction of sharp strange dibaryon resonances from certain quark-bag models. Cross sections for the associated strangeness production of light hypernuclei via the reactions (p,K^+) were measured for 2 GeV proton beams with the targets D,^{3}He and ^{4}He. Upper limits were obtained and are compared with theoretical estimates considering the effects of large momentum mismatch and short range correlations. A previous meson exchange model is being extended to allow for exclusive production of η and K^+ particles in addition to π's. The threshold excitation curve for meson production in the D(p,^{3}He)X reaction was measured by matching the incident beam energy and the ^{3}He momentum such that meson X is produced at rest in CM. The measurements show apparent signals at the ω-,η', and Φ-threshold while the vicinity of the mass of the predicted KK-tilde molecules no clear indication for their existence was found. 8 figs., 1 tab, 19 refs. (orig.).

6739 (INIS-mf–14421, pp. 70-79) **Meson Production studies at COSY.** Machner, H. (Forschungszentrum Juelich GmbH (Germany)). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

The new accelerator Cosy at Juelich is shortly described. The first approved experiments and their detectors are presented. The experiments are measurements of elastic proton-proton scattering and two meson production in the proton-deuteron interactions with a ^{3}He-recoil and in the proton-proton interactions. Further experiments make use of a time of flight apparatus. These include production of photons, associated strangeness and η's in proton-proton interactions. Experiments with a hybrid detector (Ge-wall plus Magnet spectrometer) will search for pionic atoms in low lying states and neutral meson production in proton plus deuteron reactions. 10 figs., 13 refs. (orig.).

6740 (INIS-mf–14421, pp. 228-241) **On the spectroscopy of Σ^--hypernuclei.** Petridou, Th. (Thessaloniki Univ. (Greece)). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

The (K^-,π^+)Σ^--hypernuclei spectra are studied in the context of the Green function method, using a simple potential model with a square well central part and a delta function spin-orbit Σ-nuclear-core interaction. Comparisons are made between the theoretical results and the in-flight (K^-,π^+) experimental data for $^{12}_{\Sigma}$C of the CERN and the late BNL data for $^{16}_{\Sigma}$O of the early BNL and the CERN data and for $^{6}_{\Sigma}$Li of the early BNL data for θ=13°,9°. A shallow potential, with a central potential depth of V_c=(-5-i15)MeV and a spin-orbit depth of V_{so}=15MeV, gives a satisfactory representation for these spectra. An investigation of the in-flight spectra is also made for different values of the potential parameters. The at rest spectra for $^{12}_{\Sigma}$C are calculated for two values of the potential. It is concluded that the possibility of the existence of peaks within this model for both the in-flight and the at rest spectra is related with a potential with strong or medium real and spin-orbit parts and a weak imaginary part. This simplified model, which facilitates the calculations, reaches the same conclusions with the more complicated models. 17 figs., 47 refs. (orig.).

6741 (INS–1045) **Pion-pair production by two photons.** Terazawa, Hidezumi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1994. 12p. Order Number DE95737162. Source: OSTI; NTIS; INIS.

The cross section for pion-pair production by two photons is calculated approximately by using the low energy theorem previously derived from partially-conserved-axial-vector-current hypothesis and current algebra, and found to agree very well with the experimental data recently obtained by the Mark II, TPC/Two-Gamma and CLEO Collaborations. (author).

6742 (INS–1055) **Double-strangeness five-body system.** Myint, K.S. (Mandalay Univ. (Myanmar). Dept. of Physics); Akaishi, Yoshinori. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1994. 25p. Order Number DE95737277. Source: OSTI; NTIS; INIS.

We perform theoretical analysis on the structure and decay of a double-strangeness five-body system which consists of $_{\Lambda\Lambda}{}^5$H and $_{\Xi}{}^5$H states. In this S=-2 five-body system the thresholds of the t$\Lambda\Lambda$ channel and the $\alpha\Xi^-$ channel come closer with only 8.51 MeV difference. We treat both bound and resonant states of the three-body channels t$\Lambda\Lambda$ and tpΞ^- by applying a complex rotation method. It is found that there is a bound $_{\Lambda\Lambda}{}^5$H state with 6.3 MeV

below the threshold of t+Λ+Λ. In the Ξ^- channel a resonant $_{\Xi}{}^5$H state appears at 1.7 MeV below the threshold of $\alpha+\Xi^-$. Though the existence of this state is ensured by the Coulomb interaction, it is a 'halo' nuclear state rather than an atomic state as judged from its size. The conversion width of this state is 0.2 MeV which is extremely narrow. It is also found that Ξ mixing into the $_{\Lambda\Lambda}{}^5$H ground state is small with 1.0 %. For the $_{\Lambda\Lambda}{}^5$H state, the weak decay to the $\alpha+\Sigma^-$ final state produces a high mono-energetic Σ^- with branching ratio of 5.5 %. Thus the Σ^- with discrete energy would become a clear signature of the forming of the ΛΛ hypernucleus. (author).

6743 (INS–1061) **Exotic states of hadronic atoms.** Yamazaki, Toshimitsu. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1994. 10p. Order Number DE95737276. Source: OSTI; NTIS; INIS.

Recently discovered metastable antiprotonic helium atoms are described. (author).

6744 (INS–1064) **Hadron-nucleon scattering lengths in QCD sum rules.** Morimatsu, Osamu. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1994. 13p. Order Number DE95737281. Source: OSTI; NTIS; INIS.

Recent progress of the QCD sum rule in its application to the calculation of hadron-nucleon scattering lengths is reported. After a brief introduction to the QCD sum rule, how to obtain scattering lengths in the QCD sum rule is explained. Then the results of its application are presented first for the pion-nucleon and kaon-nucleon channels and secondly for the nucleon-nucleon and hyperon-nucleon channels. (author).

6745 (LA-UR–94-3728) **Spin physics in the next decade.** Moss, J.M. (Los Alamos National Lab., NM (United States). Physics Div.). Los Alamos National Lab., NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409103–8: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95003727. Source: OSTI; NTIS; INIS; GPO Dep.

The author's personal opinion is that the fascinating field of nonperturbative QCD will be led by polarized beam experiments. He focuses on two developments which will surely produce a wealth of new physics within the next ten years. These are polarized colliding beams, and polarized jet targets in conjunction with polarized beams in storage rings. In order to make the overview manageable, he covers only selected areas where the physics goals are the elucidation of nonperturbative aspects of QCD applied to nucleons and nuclei. He discusses several areas of polarized structure function physics which will be feasible in the next 5–10 years.

6746 (LBL–34831, pp. 41-48) **Minijets in the two-component dual parton model in hadronic and heavy ion collisions.** Bopp, F.W. (Universitaet Siegen (Germany)); Pertermann, D.; Ranft, J.; Engel, R.; Kawrakow, I. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors use new fits to parton structure functions, including structure functions with Lipatov behaviour at small x-values and discuss the minijet component in the two-component Dual Parton Model with a supercritical Pomeron as demanded by the fits to cross section data. They find, that a consistent model can only be formulated with a $p_{\perp thr}$ cut-off increasing with energy. The implications for particle production in hadronic and heavy ion collisions are discussed.

6747 (LBL–34831, pp. 235-242) **Signatures for QGP in dilepton spectrum.** Asakawa, M. (Texas A&M Univ., College Station, TX (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. Source: OSTI; NTIS; INIS.

The author discusses two ideas to verify the formation of the quark-gluon plasma in ultrarelativistic heavy ion collisions using dileptons. The most prominent feature that distinguishes the quark-gluon plasma from the hadron phase lies in the degree of freedom. This is reflected in the electromagnetic form factors. In the quark-gluon phase, quarks couple to the virtual photon directly. On the other hand, in the hadronic phase the degrees of freedom are hadrons and their couplings to the virtual photon are modified from the bare ones, which reflects the compositeness of hadrons. This simple fact makes it possible to distinguish dileptons from the two phases using the M_T scaling. Another trivial but interesting point is that if the quark-gluon plasma is created in heavy ion collisions, the system eventually must return to the normal hadronic phase. In this course, a phase transition takes place. Phase transition is characterized by the singular behavior of order parameters. If phase transition is first order, order parameters are not continuous at the phase transition point. If phase transition is second order, it is the first derivative of order parameters that is not continuous at the phase transition point.

6748 (SLAC-PUB–6601) **A study of K_s Λ and $\bar{\Lambda}$ production in hadronic Z^0 decays.** Baird, K.G. (Rutgers Univ., New Brunswick, NJ (United States)). SLD Collaboration. We present a preliminary measurement of the inclusive production rates of K_s, Λ and X hadrons produced in e^+e^- annihilation at the Z^0 pole. The analysis is based upon approximately 50K Z^0 decays collected in the SLD experiment at SLAC in 1993. The observed rates of $\langle K_s \rangle = 1.02 \pm 0.02 \pm 0.09$ and $\langle \Lambda \rangle + \langle \bar{\Lambda} \rangle = 0.38 \pm 0.01 \pm 0.04$ are consistent with previous measurements. Our differential cross section peak-position results are shown to be consistent with QCD predictions based on the modified leading logarithm approximation and local parton-hadron duality.

6749 (SLAC-PUB–6707) **Geometry of multihadron production.** Bjorken, J.D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409257–1: 24. international symposium on multiparticle dynamics, Vietri sul Mare (Italy), 12-19 Sep 1994). Order Number DE95004290. Source: OSTI; NTIS; INIS; GPO Dep.

This summary talk only reviews a small sample of topics featured at this symposium: Introduction; The Geometry and Geography of Phase space; Space-Time Geometry and HBT; Multiplicities, Intermittency, Correlations; Disoriented Chiral Condensate; Deep Inelastic Scattering at HERA; and Other Contributions.

We have searched for production of $t\bar{t}$ pairs in $p\bar{p}$ interactions at 1.8 TeV center-of-mass energy at the FNAL Tevatron collider. The search assumes standard model decay for top quark into W + b quark. We observe in μ + jets and 14 + jets final states a small, not statistically significant, excess above the background estimated by two different methods. The results presented are preliminary.

6751 (BNL–61012) **Introduction to the physics of Higgs bosons.** Dawson, S. Brookhaven National Lab., Upton, NY (United States). Nov 1994. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9405267–1: 1994 Theoretical Advanced Study Institute conference, Boulder, CO (United States), 30 May - 23 jun 1994). Order Number DE95003965. Source: OSTI; NTIS; INIS; GPO Dep.

A basic introduction to the physics of the Standard Model Higgs boson is given. We discuss Higgs boson production in e^+e^- and hadronic collisions and survey search techniques at future accelerators. The Higgs bosons of the minimal SUSY model are briefly considered. Indirect limits from triviality arguments, vacuum stability and precision measurements at LEP are also presented.

The authors present preliminary measurements of the W boson mass made by the D0 and CDF experiments using data collected at the Fermilab TeVatron $\bar{p}p$ collider operating at $\sqrt{s}$ = 1.8 TeV. The result from the CDF $W \rightarrow e\nu$ data analysis is $M_W = 80.47 \pm 0.15(stat) \pm 0.25(sys)$ GeV/c^2 and the result from the CDF $W \rightarrow \mu\nu$ data analysis is $M_W = 80.29 \pm 0.20(stat) \pm 0.24(sys)$ GeV/c^2. The result from the D0 $W \rightarrow e\nu$ data analysis is $M_W = 79.86 \pm 0.16(stat) \pm 0.31(sys)$ GeV/c^2. When combined with the previous measurements, these results yield a world average value of M_W, 80.23 ± 0.18 GeV/c^2.

6753 (FNAL/C–94/282-E) **A measurement of the mass of the W vector boson at CDF.** Keup, R.M. (Illinois Univ., Urbana, IL (United States). Dept. of Physics). CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Source: OSTI; NTIS; INIS; GPO Dep.

We present a preliminary measurement of the mass of the W vector boson using the decays $W \rightarrow ev$ and $W \rightarrow \mu\nu$. The mass of the W is an important parameter of the standard model. Through its relation to both the top quark and the higgs sector, it provides a sensitive probe of the electroweak theory. During the last run of Fermilab's Tevatron, CDF recorded $\bar{p}p$ collisions at $\sqrt{s}$ = 1.8 TeV corresponding to an integrated luminosity of 19.3 pb^{-1}. An analysis of both decay channels yields a combined mass measurement of Mw = 80.38 ± 0.23 GeV/c.

6754 (FNAL/C–94/328-E) **Measurement of correlated b quark cross sections at CDF.** Gerdes, D. CDF Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Ministry of Education, Science and Culture (Japan);Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada);Istituto Naz DOE Contract AC02-76CH03000. (CONF-940816–67: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95004240. Source: OSTI; NTIS; INIS; GPO Dep.

Using data collected during the 1992–93 collider run at Fermilab, CDF has made measurements of correlated b quark cross section where one b is detected from a muon from semileptonic decay and the second b is detected with secondary vertex techniques. We report on measurements of the cross section as a function of the momentum of the second b and as a function of the azimuthal separation of the two b quarks, for transverse momentum of the initial b quark greater than 15 GeV. Results are compared to QCD predictions.

6755 (FNAL/C–94/331-E) **Search for supersymmetry and leptoquark states at FNAL.** Hagopian, S. (Florida State Univ., Tallahassee, FL (United States). Dept. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940722–32: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95003381. Source: OSTI; NTIS; INIS; GPO Dep.

Searches have been made for first generation scalar and vector leptoquarks by the D0 collaboration and for second generation scalar leptoquarks by the CDF collaboration. The data sample is from the 1992-93 $p\bar{p}$ run at $\sqrt{s}$ = 1.8 TeV at the Fermilab Tevatron Collider. Assuming that leptoquarks are pair produced and decay into charged leptons and quarks with branching fraction β, mass limits at the 95% Confidence Level (CL) have been obtained. For first generation scalar leptoquarks the lower mass limit is 130 GeV/c^2 for β = 1.0 and 116 GeV/c^2 for β = 0.5. For first generation vector leptoquarks with κ, the anomalous coupling, of 1.0 and β = 1.0, the lower mass limit is 240 GeV/c^2 and for κ = 1.0, β = 0.5, the lower mass limit is 240 GeV/c^2. For κ = 0 and β = 1.0, the lower mass limits is 190 GeV/c^2 and for κ = 0, β = 0.5, the lower mass limit is 185 GeV/c^2. For second generation scalar leptoquarks, the mass limits are 133 GeV/c^2 for β = 1.0 and 98 GeV/c^2 for β = 0.5. A search for squarks and gluinos, predicted by Supersymmetric models, was made by D0 in the three or more jets plus E_t channel. The number of events observed was consistent with background. For heavy squarks, a lower gluino mass limit of 146 GeV/c^2 was obtained, and for equal squark and gluino masses a mass limit of 205 GeV/c^2 was obtained at the 95% CL.

6756 (FNAL/C–94/339-E) **Evidence for top quark production in 1.8 TeV $\bar{p}p$ collisions.** Jensen, H.B. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-940722–33: 27. international conference on high energy physics, Glasgow (United Kingdom), 21-27 Jul 1994). Order Number DE95003496. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a summary of the evidence for top quark production in $\bar{p}p$ collisions at a center of mass energy of 1.8 TeV which was obtained by the CDF Collaboration earlier this year. The data analyzed corresponds to an integrated luminosity of 19.3 pb^{-1}, recorded with the CDF Detector at the Fermilab Tevatron Collider during 1992-1993. Three different search channels for $t\bar{t}$ production are used. A search for dilepton events finds 2 events, while two different methods of identifying b-quark jets in events with $W+ \geq 3$ jets finds 6 and 7 events, respectively. The probability that the observed total yield is consistent with the estimated background of $5.96_{-0.44}{}^{+0.49}$ is 0.26%. Though the statistics are too limited to firmly establish the existence of the top quark, a natural interpretation of the excess is that it is due to $t\bar{t}$ production. Under this assumption, constrained mass fitting of a subset of events yields a top quark mass of $174 \pm 10_{-12}{}^{+13}$ GeV/c^2 and a $t\bar{t}$ production cross section of $13.9_{-4.8}{}^{+6.1}$ pb.

6757 (INIS-RU–379, pp. 55-57) **Photoproduction of a hypothetic neutral particle in oriented monocrystal.** Kunashenko, Yu.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The production of X^0 particles by high energy photons in oriented monocrystals is discussed as a means of particle detection. Particle production in continous potentials of crystallographic axices or planes and coherent photoproduction are considered. The calculations showed 10^{-3} photon yield from 1 cm Ge monocrystal. 9 refs.

6758 (SLAC-PUB–6620) **Spin structure of the nucleon and polarization.** Prescott, C.Y. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1994. 4p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-940693–5: Conference on physics in collision, Tallahassee, FL (United States), 15-17 Jun 1994). Order Number DE95004282. Source: OSTI; NTIS; INIS; GPO Dep.

Recent experiments at CERN and SLAC have added new knowledge about the spin structure of the proton and the deuteron. A brief historical background is presented, the status of experiments is discussed, and progress in the understanding of the spin of the nucleon in the context of the quark parton model is summarized.

6759 (INIS-mf–14421) **Nuclear physics, neutron physics and nuclear energy. Proceedings.** Andrejtscheff, W.; Elenkov, D. (eds.). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

The book contains of proceedings of XI International School on Nuclear Physics, Neutron Physics and Nuclear Energy organized traditionally every two years by Bulgarian Academy of Sciences and the Physics Department of Sofia University held near the city of Varna. It provides a good insight to the large range of theoretical and experimental results, prospects, problems, difficulties and challenges which are at the core of nuclear physics today. The efforts and achievements of scientists to search for new phenomena in nuclei at extreme circumstances as .superdeformation and band crossing in nuclear structure understanding are widely covered. From this point of view the achievements and future in the field of high-precision γ-spectroscopy are included. Nuclear structure models and methods, models for strong interaction, particle production and properties, resonance theory and its application in reactor physics are comprised also. (V.T.).

In order to make it easy for the reader to see the specific research carried out and the progress made, the following report of progress is done by topic. Each item has a format layout of Topic, Investigators, Objective, Significance, and Description of Progress, followed at the end by the relevant references. As is clear from the topics listed, the emphasis of the GW nuclear theory group has been on the structure and electromagnetic interactions of few-body nuclei. Both low- and intermediate-energy electromagnetic disintegration of these nuclei is considered, including coherent photoproduction of π mesons. When the excitation energy of the target nucleus is low, the aim has been to handle the continuum part of the theoretical work numerically with no approximations, that is, by means of full three- or four-body dynamics. When structure questions are the issue, numerically accurate calculations are always carried through, limited only by the underlying two-body or three-body interactions used as input. Implicit in our work is the question of how far one can go within the traditional nuclear physics framework i.e., nucleons and mesons in a nonrelativistic setting. Our central goal is to carry through state-of-the-art few-body calculations that will serve as a means of determining at what point standard nuclear physics requires introduction of relativity and/or quark degrees of freedom in order to understand the phenomena in question. So far, the problems considered were mostly concerned with low- to medium-energy regimes where little evidence was found that requires going beyond the traditional approach.

The goal of this work is to establish detailed level schemes fed in a β-decay chain to identify new possible positive-parity Nilsson bands, to establish low-lying state systematics and extract deformation parameters. At the frontier of the light actinide region the existence of an octupole deformation at very low excitation energy as theoretically predicted has been experimentally searched. The neutron-deficient isotopes studied have been produced by fusion evaporation reactions induced by medium or heavy ions projectiles at 5-7 MeV/nucleon energies on thin metallic targets. On-line mass separation and He-jet techniques have been used at the SARA accelerator. ^{96}Mo+^{40}Ca system at 255 MeV has been used to produce ^{131}Nd, ^{131} Pr and search for a ^{131m}Pr isomeric state. The ^{131}Nd→^{131}Pr→^{131}Ce radioactive decay chain is studied. The ^{131}Ce level scheme observed in the ^{131m,g}Pr decay is proposed. The ^{129}Nd→^{129}Pr→^{129}Ce poorly known radioactive decay chain is investigated. To produce Nd and Pr activities the ^{94}Mo + ^{40}Ca system at 255 MeV has been used. On this basis the ^{129}Ce level scheme observed in the ^{129}Pr β^+ decay is proposed. The low-lying state systematics in odd-A Ce isotopes and the systematics of low-energy positive parity sates observed in odd-A $^{129-135}$Pr are established. The ^{2}23Th isotope has been produced by fusion reaction ^{208} Pb + ^{18}O at 82 MeV. A new level scheme is proposed for ^{219} Ra populated in the ^{223} Th decay at low energy including a tentative correlation between alpha decay studies and in beam results. The ^{215}Rn nucleus has been studied in the alpha decay of ^{219}Rn in secular equilibrium with ^{223}Th (T1/2=0.66s) as a by-product in the preceding measurements and the level structure of ^{215} Rn is constructed. 16 figs., 1 tab., 43 refs. (orig.).

(CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that systematics of the type evidenced by Mallmann for the quasiground band are obeyed by energy ratios within other bands as well. Correlations between different energy ratios are studied by using their associated 'symmetry triangle', which can be used both to find other universal systematics and to characterize the evolution of the nuclear collectivity with respect to the basic dynamical symmetries. Finally, the nearly universal anharmonic vibrator description of the quasiground band in the non-deformed

collective nuclei is extended to non-yrast states, its transition towards the rotor behaviour having the character of a critical phase transition. 14 refs. (orig.).

This paper illustrates the contribution of laser spectroscopy to authors knowledge about nuclear structure properties, in particular about variations of nuclear charge radii in long isotopic and isotonic chains comprising stable and short lived isotopes. The experiments are performed at Flerov Laboratory of Nuclear Reactions (FLNR), JINR. The changes in the mean square (ms) charge radii and nuclear moments are measured for two nuclei: $_{72}$Hf with average neutron number of about 107 which is located closely beyond the well investigated rare earths in the very interesting mass region of strongly deformed nuclei; and $_{22}$Ti, the stable isotopes of which lie within the very interesting shell $20 \leq N, Z \leq 28$ which is just in the Z region with a large lack of optical information on nuclear properties. All stable hafnium isotopes and its long living isotope ^{182}Hf ($T1/2=9\times10^{6}$ years) have been investigated. The optical and muonic data predict different behaviour of the nuclear deformation in the Hf mass region investigated. The changes of ms nuclear charge radii of Ti stable isotopes extracted from optical IS are reported for the first time. On the basis of investigation it is concluded that the charge radius variation is very sensitive to the model predictions and can serve as a probe for model validity. The most conspisuous feature of the nuclear charge radius is the strong deviation from the prediction of the spherical droplet model requiring the inclusion of different multipolarity deformation effects. An extension of the droplet model includes deformation effects using theoretical results on nuclear deformation, for example third order of quadrupole deformation, which discriminates between prolate and oblate shape or a generalization which includes thriaxial shape. The predictions on this basis are affected by corresponding uncertainties but in general in many cases even for long isotopic chains, an impressive coincidence is achieved.

6765 (INIS-mf–14421, pp. 135-152) **Baryon mapping of quark systems.** Pittel, S. (Delaware Univ., Newark, DE (United States). Bartol Research Inst.); Arias, J.; Dukelsky, J.; Frank, A. Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

A colorless baryon mapping of three-quark clusters, specifically tailored to physical constituent quark models in which Hamiltonian may contain up to three-quark interactions and is a color scalar are presented. It is tested in the context of a three color extension of the Lipkin model. It is found that the mapping exactly reproduces (within its physical subspace) the full spectrum of states of the original quark model. Furthermore, when the mapping is implemented in its nonhermitian version, the unphysical states (those that are pure artefact of the mapping and have no physical relevance) are pushed up in energy. Despite the very promising results of these test calculations, there is still more to do before concluding that the mapping can be used to derive nuclei from real constituent quark models as is the authors ultimate goal. There are two additional tests which have to be performed, successfully and then turn to study of real nuclei. The authors main goal was to see to what extent traditional nuclear physics can be described directly from quarks. 2 figs., 10 refs. (orig.).

6766 (INIS-mf–15050) **Gamma-ray spectroscopy for investigation of the co-existence of deformed and spherical states in the magic nucleus of ^{114}Sn.** Schimmer, M. Koeln Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. 5 May 1993. 150p. (In German). Order Number DE95726936. Source: OSTI; NTIS (US Sales Only); INIS.

The term diagram of the $_{50}{}^{114}Sn_{64}$ magic nucleus could be enlarged by 77 newly identified gamma transitions and 47 novel energy levels identified by way of a gamma-gamma coincidence measurement using the OSIRIS hexahedral spectrometer and by means of the high-spin reaction of $^{100}Mo(^{18}O,4n)^{114}Sn$ at an injection energy of $E(^{18}O) = 70$ MeV. Spins up to an excitation energy of $\propto$ 11.2 MeV and up to a maximum spin of 23 h have been occupied. For identification of the multipolarities of low-intensity γ-transitions which deplete the high-spin states, $\gamma\gamma$-angular correlations have been evaluated, and 26 energy levels could be clearly assigned for the first time to measured spin values. For an interpretation of further nuclear structural states of ^{114}Sn theoretical calculation have been made based on the shell model of nucleus. (orig./DG)

6767 (INS–1068) **The meaning of Dirac's large number hypothesis.** Terazawa, Hidezumi. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Oct 1994. 10p. Order Number DE95737280. Source: OSTI; NTIS; INIS.

Dirac's large number hypothesis (LNH) states that the Eddington large numbers $N_1(\equiv\alpha/Gm_em_p\simeq10^{39})$, $N_2(\equiv m_e/\alpha H\simeq10^{40})$ and $N_3(\equiv4\pi\rho/3m_pH^3\simeq10^{80})$ are not independent but related with each other. By reconsidering the meaning of the LNH, it is shown that not only the 'dynamical' LNH relation of N_3-N_1N_2 but also the 'geometrical' LNH relation of N_3-$(N_2)^2$ holds so that the LNH may not be taken as a hypothesis but become the large number rule (LNR). (author).

(CONF-9409242–2: CORINNE 2: international conference on multiparticles correlation and particle production in nucleus-nucleus collisions, Nantes (France), 5-9 Sep 1994). Order Number DE95003418. Source: OSTI; NTIS; INIS; GPO Dep.

The multifragmentation of gold nuclei at 1 GeV/nucleon has been studied using reverse kinematics. The moments of the resulting charged fragment distribution have been analyzed using methods borrowed from percolation theory. These moments provide clear evidence for critical behavior occurring in a system of about 200 nucleons. The critical exponents extracted from the data are close to those of liquid-gas systems.

6770 (LBL–36206) **Excitation of a quantal and a classical gas in a time-dependent potential.** Blocki, J. (Inst. for Nuclear Studies, Otwock-Swierk (Poland)); Brut, F.; Skalski, J.; Swiatecki, W.J. Lawrence Berkeley Lab., CA (United States). 28 Sep 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9408180–2: 4. KINR international school on nuclear physics, Kiev (Russian Federation), 29 Aug - 7 sep 1994). Order Number DE95003426. Source: OSTI; NTIS; INIS; GPO Dep.

We report on computer simulations of oscillating Woods-Saxon or cavity potentials filled with either a classical or a quantal gas of independent particles. We have now available of the order of 600 excitation histories of such gases undergoing usually one period of

oscillation (but sometimes several), classified according to frequency and multipolarity of the oscillation and of the degree of diffuseness of the potential. We are still in the process of displaying and interpreting some of the results, but certain important features are already apparent. A notable finding is that, contrary to concerns sometimes voiced in the literature, the classical wall formula does not fail catastrophically when confronted with quantal calculations. This is true even for relatively small systems – in our case 112 neutrons in doubly degenerate eigenstates. On the contrary, the wall formula, in addition to reproducing accurately the classical computer simulations, gives also an approximate account of the quantal results in the regime where it is expected to be valid, namely for not too small oscillation frequencies and not too large surface diffuseness. In those cases it is gratifying to observe that the deviations from the wall formula actually correlate (semiquantitatively) with the wave-mechanical corrections derived by Koonin et al.

6771 (SLAC-PUB–6729) **The impact of QCD and light-cone quantum mechanics on nuclear physics.** Brodsky, S.J. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Schlumpf, F. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409259–1: Electromagnetic probes and the structure of hadrons and nuclei, Erice (Italy), 15-23 Sep 1994). Order Number DE95004293. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss a number of novel applications of Quantum Chromodynamics to nuclear structure and dynamics, such as the reduced amplitude formalism for exclusive nuclear amplitudes. We particularly emphasize the importance of light-cone Hamiltonian and Fock State methods as a tool for describing the wavefunctions of composite relativistic many-body systems and their interactions. We also show that the use of covariant kinematics leads to nontrivial corrections to the standard formulae for the axial, magnetic, and quadrupole moments of nucleons and nuclei.

6772 (INIS-mf–14421, pp. 1-27) **Superdeformed bands in the A≈130 region.** Gizon, J. (Institut des Sciences Nucleaires, IN2P3/CNRS - Universite Joseph Fourier, Grenoble Cedex (France)). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

Discovery, some typical features, origin, population and deexcitation of superdeformed bands (SD) are briefly reviewed. The last generation arrays are designed to study very weak amplitudes phenomena and they must have a large efficiency and large resolving power. Compared to the previous γ-ray spectrometers the new generation (EUROGAM and GASP already operating, GAMMASPHERE under construction, EUROBALL and TRIGAMM project) is characterized by a much greater number of Ge detectors and a total peak efficiency 10 or 20 times larger. The main characteristics of the new arrays: EUROGAM and GASP are given. The first observation of the SD bands in the 130 mass region based on two experiments is reported. The first nucleus studied is ^{132}Ce produced in the ^{100}Mo(^{36}S,4n) reaction at 155 MeV. The γ-rays were detected by 42 Ge detectors of EUROGAM 1. Two excited SD bands have been identified in ^{132}Ce. The first one is composed of 13 transitions of energies between 794 and 1687 KeV and another of 12 transitions between 947 and 1725 KeV. Another experiment has been performed using EUROGAM to search for excited SD bands in ^{133}Pr produced by reaction ^{100}Mo(^{37}Cl,4n) at 155 MeV. Four SD bands have been discovered in ^{133}Pr with transitions ranging from 0.8 to 1.6 MeV. The observation of identical SD bands in Ce and Pr isotopes and the decay out of the yrast SD bands in ^{133}Nd and ^{135}Nd are discussed. The new projects on other arrays of the third generation as EUROBALL, GAMMASPHERE, TRIGAM are briefly reviewed. It is emphasized that the use of new arrays will give the possibility to observe weaker amplitude phenomena like the hyperdeformation also predicted in the mass 130 region. 21 figs., 46 refs.(orig.).

6773 (INIS-mf–14421, pp. 152-175) **Euroball III, a European γ-ray facility and superdeformation in Gd nuclei around A=146.** Lieder, R. (Kernforschungsanlage Juelich GmbH (Germany)). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

Summarized are the main lines of investigations of new phenomena in nuclei under extreme circumstances close to the limit of stability for which the excitation energy, the angular momentum or the ratio of protons to neutrons take extreme values. It is emphasized that the most powerful means to carry out such experiments is the high precision γ-ray spectroscopy. Discussed are the main features of γ-ray detectors which have to be optimized as a photopeak efficiency, peak/total ratio, energy resolution, isolated hit probability. The Nordball spectrometer in the study of the superdeformed band in ^{143}Eu is described. The Euroball project and the γ-detector array Euroball III to be used in the project experiments are discussed. The main advantages of Cluster detector, encapsulated Ge detector and BGO escape-suppression detector are outlined. To search for superdeformation in ^{144}Gd an experiment at the γ-spectrometer GASP has been performed using the reaction ^{100}Mo(^{48}Ti,4n) at a beam energy 221 MeV. Using the Radford package, 14 coincident transition are identified and a double-gated coincidence spectrum of the resulting superdeformed band is obtained. The intensity of the superdeformed band was estimated to be ≈0.2% of the total population of the nucleus ^{144}Gd. The weak population of the superdeformed band in ^{144}Gd explain why it is not possible to detect it in the previous experiments. The three close lying transitions at ≈ 890 KeV indicate that the superdeformed band in ^{144} Gd undergoes a band crossing at a rotational frequency of $\hbar\omega$=0.45 MeV. This is the first experimental observation of a crossing in a superdeformed band related to the alignment of a proton pair. An open question is the small intensity of the superdeformed band in ^{144} Gd. 14 figs., 36 refs. (orig.).

6774 (ANL/PHY/CP–84791) **Recent results from APEX.** Ahmad, I. (Argonne National Lab., IL (United States). Physics Div.); Back, B.B.; Austin, S.M. Argonne National Lab., IL (United States). Physics Div. [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940888–1: Physics with large gamma ray decector arrays conference, Berkley, CA (United States), 2-6 Aug 1994). Order Number DE95004122. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of the APEX project is the study of the emission of electrons and positrons from collisions of heavy ions. However, scattering of this type involves intense Coulomb excitation of nuclear states so nuclear spectroscopy can never be far from one's mind. The authors also have close connections with the conference title; the detector which they describe does contain two large gamma arrays, each subtending 58% of 4π and containing 24 position sensitive detectors. Finally, they will see their research may have uncovered some interesting new spectroscopy in the actinides, so the connections between APEX and this conference may be closer than is first apparent.

6775 (BNL–61005) **Sum rule measurements of the spin-dependent compton amplitude (nucleon spin structure at Q^2 = 0).** Babusci, D. (Laboratori Nationali di Frascati-INFN, Rome (Italy)); Giordano, G.; Baghaei, H.; Cichocki, A.; Blecher, M.; Breuer, M.; Commeaux, C.; Didelez, J.P.; Caracappa, A.; Fan, Q. Brookhaven National Lab., Upton, NY (United States). [1995]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95003947. Source: OSTI; NTIS; INIS; GPO Dep.

Energy weighted integrals of the difference in helicity-dependent photo-production cross sections ($\sigma_{\frac{1}{2}} - \sigma_{3/2}$) provide information on the nucleon's Spin-dependent Polarizability (γ), and on the spin-dependent part of the asymptotic forward Compton amplitude through the Drell-Hearn-Gerasimov (DHG) sum rule. (The latter forms the Q^2=0 limit of recent spin-asymmetry experiments in deep-inelastic lepton-scattering.) There are no direct measurements of $\sigma_{\frac{1}{2}}$ or $\sigma_{3/2}$, for either the proton or the neutron. Estimates from current π-photo-production multipole analyses, particularly for the proton-neutron difference, are in good agreement with relativistic-I-loop Chiral calculations (χPT) for γ but predict large deviations from the DHG sum rule. Either (a) both the 2-loop corrections to the Spin-Polarizability are large and the existing multipoles are wrong, or (b) modifications to the Drell-Hearn-Gerasimov sum rule are required to fully describe the isospin structure of the nucleon. The helicity-dependent photo-reaction amplitudes, for both the proton and the neutron, will be measured at LEGS from pion-threshold to 470 MeV. In these double-polarization experiments, circularly polarized photons from LEGS will be used with SPHICE, a new frozen-spin target consisting of $\vec{H} \cdot \vec{D}$ in the solid phase. Reaction channels will be identified in SASY, a large detector array covering about 80% of 4π. A high degree of symmetry in both target and detector will be used to minimize systematic uncertainties.

6776 (DOE/ER/40561–167) **Anisotropy of dilepton emission from nuclear collisions.** Bratkovskaya, E.L. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Bogolubov Lab. of Theoretical Physics); Teryaev, O.V.; Toneev, V.D. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. 7 Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States);International Science Foundation. DOE Contract FG06-90ER40561. Grant N0 MP8000. Order Number DE95004354. Source: OSTI; NTIS; INIS; GPO Dep.

Attention is paid to studying the angular characteristics of e^+e^- pairs created in collisions with nuclear targets at intermediate and relativistic energies. Arising due to general spin and angular momentum constraints, the dilepton anisotropy seems to be quite sensitive to the contribution of different sources and may be used for disentangling these sources (or models) as well as an additional signature of a possible chiral symmetry restoration and phase transition of hadrons into the quark-gluon plasma. An anisotropy estimate for some dilepton sources is given and its relevance to the problems mentioned is discussed.

6777 (DOE/ER/40561–169) **Nuclear multifragmentation critical exponents.** Bauer, W. (Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory); Friedman, W.A. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561. Order Number DE95004356. Source: OSTI; NTIS; INIS; GPO Dep.

In a recent Letter, cited in a reference, the EoS collaboration presented data of fragmentation of 1 A GeV gold nuclei incident on carbon. By analyzing moments of the fragment charge distribution, the authors claim to determine the values of the critical exponents γ, β, and τ for finite nuclei. These data represent a crucial step forward in the understanding of the physics of nuclear fragmentation. However, as shown in this paper, the analysis presented in the cited reference is not sufficient to support the claim that the critical exponents for nuclear fragmentation have been unambiguously determined.

6778 (DOE/ER/40764–3) **Theory of ultra dense matter and the dynamics of high energy interactions involving nuclei. Progress report, December 15, 1993–December 14, 1994.** Gyulassy, M. Columbia Univ., New York, NY (United States). 12 Sep 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER40764. Order Number DE95004114. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the progress made during the second year of the three year DOE agreement DE-FG02-93ER40764 on theoretical nuclear physics research performed at the Columbia University and presents a detailed budget adjustment for the third year period December 15, 1994 to December 14, 1995. Sections 1.1 to 1.8 highlight the technical progress made on the following general areas: Multiple scattering and radiative processes in QCD; the quark-gluon plasma transition in nuclear matter; QCD transport theory and dissipative mechanism in dense matter; phenomenological models of high energy interactions involving nuclei; signatures of quark-gluon plasma formation in A+A; neurocomputation theory. Section 2 contains a bibliography of published papers and invited conference papers. Section 3 lists the Columbia nuclear theory members for the December 15, 1994 to December 14, 1995 period. Finally, the budget adjustment requesting $319,830 for the third year relative to the original $320,000 is presented in section 6. Copies of the research papers accompany this report.

6779 (INIS-mf–14421, pp. 38-45) **Near-threshold π^0-production on ^{24}Mg with ^{4}He of 43 and ^{16}O of 24 and 33 MeV·A.** Ernst, J. (Bonn Univ. (Germany). Inst. fuer Strahlen- und Kernphysik). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

The near-threshold π^0-production on ^{24}Mg with ^{4}He of 43 and ^{16}O of 24 and 33 MeV·A was studied with a lead glass shower detector. The cross sections of 3.5 nb and 6.6. nb from the ^{16}O induced reactions are compatible with other experiments. For the α-induced reaction a sizable yield of 1.3 nb was found, only 22 MeV above the absolute threshold and far below the Δ-resonance. The differential cross sections at very backward angles are by an order of magnitude bigger than those at 90° indicating the π^0's being produced at the front end of the larger target nucleus. 5 figs., 2 tabs., 10 refs. (orig.).

6780 (INIS-mf–14421, pp. 80-93) **Antiproton annihilation at rest.** Machner, H. (Forschungszentrum Juelich GmbH (Germany)). Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika; Sofia Univ. (Bulgaria). Katedra po Atomna Fizika. 1994. 241p. (CONF-9310392–: 11. international school on nuclear physics, neutron physics and nuclear energy, Varna (Bulgaria), 4-11 Oct 1993). In *Nuclear physics, neutron physics and nuclear energy. Proceedings.* Order Number DE95611127. Source: OSTI; NTIS (US Sales Only); INIS.

Antiproton annihilation at rest with nuclei mainly uranium has been investigated by studying energy spectra, mass distributions of residual nuclei with activation techniques and correlation measurements of fragments with a fission fragment spectrometer. These studies gave insights in the reaction process which has several steps occuring on different time scales. The residual nucleus distribution from a ^{238}U target shows that both symmetric and asymmetric fission take place. Detection and analysis of coincident ^{209}Bi, ^{232}Th and ^{238}U enabled us to determine the individual and total mass distributions of the fragments, their opening angle, the average excitation energy and momentum of the nucleus at scission, and the number of nucleons emitted before and after scission. We have found that the process is asymmetric for low excitation energies and symmetric for higher ones. INC calculations have reproduced the experimental results. 15 figs., 2 tabs., 35 refs. (orig.).

6781 (INS–1067) **Evidence of central repulsion potential from pionic decay of s-shell Λ-hypernuclei.** Kumagai-Fuse, I. (Hokkaido Univ., Sapporo (Japan). Dept. of Physics); Okabe, S.; Akaishi, Y. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Oct 1994. 12p. Order Number DE95737279. Source: OSTI; NTIS; INIS.

Pionic decays of A=4 and 5 hypernuclei are discussed to obtain information about a nucleus-Λ potential. Results for the available decay widths support as a whole that the nucleus-Λ potential has central repulsion not only in A=5 but also in A=4 hypernuclei. (author).

6782 (JAERI-M–94-019, pp. 28-36) **Recent nuclear data activities in China related to CENDL-2.** Zhao Zhixiang (Chinese Nuclear Data Center, Beijing, BJ (China)); Zhang Jingshang. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). Recent nuclear data activities in China related to CENDL-2 is summarized in this presentation. (author).

6783 (JAERI-M–94-019, pp. 171-178) **Measurements of thermal neutron cross section and resonance integral for the ^{237}Np(n,γ)^{238}Np reaction.** Kobayashi, Katsuhei (Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst.); Yamanaka, Akihiro; Kimura, Itsuro. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

Making use of a standard neutron spectrum field with a pure Maxwellian distribution at the heavy water thermal neutron facility of the Kyoto University Reactor (KUR), thermal neutron cross section for the ^{237}Np(n,γ)^{238}Np reaction was measured by the activation method, using a high purity Ge detector. The result is 158±3b, which is obtained relative to the reference value of 98.65±0.09b for the ^{197}Au(n,γ)^{198}Au reaction. The present value is lower by about 7% than that with the ENDF/B-V data. The data given by Mughabghab and obtained from JENDL-3 are larger by 11 to 15% than the present measurement. The resonance integral for the ^{237}Np(n,γ)^{238}Np reaction was measured with a 1/E standard neutron spectrum in the cavity of the central graphite reflector region between the two-divided cores of the Kinki University Reactor (UTR-KINKI), relative to the reference value of 1550±28b for the ^{197}Au(n,γ)^{198}Au reaction. By defining the Cd cut-off energy as 0.5eV, present resonance integral is 652±24b, which is in good agreement with the JENDL-3, ENDF/B-V and Mughabghab data. However, most of the old experimental data are, in general, larger by 24 to 38% than the present measurement. (author).

6784 (JAERI-M–94-068, pp. 14-25) **Processing of covariance file and related problems.** Hasegawa, Akira (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1994. (CONF-9307182–: Specialists' meeting on covariance data, Tokai (Japan), 15-16 Jul 1993; INDC(JPN)–171/U). In *Proceedings of the specialists' meeting on covariance data.* 95p. Order Number DE94013048. Source: OSTI; NTIS; INIS.

Processing methods for generating broad group covariance data from ENDF/B format data are described briefly. Outline of covariance file, FORMAT, available processing codes, and processed data generally available are also described. Encountered problems from the processing of ENDF/B files are reviewed. Comments on the compilation strategy for JENDL covariance file, which is in scheduled, are made. (author).

6785 (JAERI-M–94-068, pp. 26-28) **Experience on preparation of a covariance library for the NEUPAC code.** Iguchi, T. (Tokyo Univ. (Japan). Faculty of Engineering). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1994. (CONF-9307182–: Specialists' meeting on covariance data, Tokai (Japan), 15-16 Jul 1993; INDC(JPN)–171/U). In *Proceedings of the specialists' meeting on covariance data.* 95p. Order Number DE94013048. Source: OSTI; NTIS; INIS.

Some comments are given for making group averaged covariance matrices through an experience of preparation of a dosimetry cross section and covariance library for the spectrum adjustment code, 'NEUPAC'. (author).

6786 (KFK–5394) **First measurement of the energy spectrum of electron neutrinos from μ^+-decay.** Kleifges, M. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Kernphysik; Karlsruhe Univ. (T.H.) (Germany). Fakultaet fuer Physik. Aug 1994. 102p. (In German). Order Number DE95731723. Source: OSTI; NTIS (US Sales Only); INIS.

The neutrino experiment KARMEN has been performing measurements for more than 4 years at the spallation source ISIS at the Rutherford-Appleton-Laboratory in Great Britain. In the experiment the neutrinos ν_μ, ν_e and anti ν_μ from the pion decay chain in the ISIS target are detected in a 56t-liquid scintillator calorimeter. Besides the search for neutrino oscillation in the chanel $\nu_\mu \rightarrow \nu_e$ and anti $\nu_\mu \rightarrow$ anti ν_e the other main physics aim is the investigation of the neutrino-nucleus interaction by neutral and charged weak currents. This report concentrates on the exclusive nuclear excitation by the charged current $\nu_e + {}^{12}C \rightarrow {}^{12}N_{g.s.} + e^-$. Due to the sequential signature as a result of ^{12}N-decay this reaction allows an investigation with high signal to background ratio 34:1. The analysis of the data since June 1990 yields 291 events of which 8.3 were assigned to background events. Hence the flux averaged cross section of the exclusive nuclear excitation in the energy range 0-53 MeV was measured to be left angle σ right angle $_{cc}$=[9.1±0.55(stat.)±0.74(syst.)]x10^{-42} cm^2 which is in good agreement with theoretical calculations. Besides this result, the good calorimetric properties of the KARMEN detector make it possible to unfold the primary energy of the detected electrons. This unfolding enabled both the energy dependent cross section and the energy distribution of the electron neutrinos from unpolarized μ^+-decay to be determined. The measurement of the ν_e-energy spectrum from the μ^+-decay offers a totally new and highly sensitive possibility for the study of the Lorentz structure of this weak decay. The influence of possible scalar and tensor coupling components, that could give a hint on physics beyond the standard model, is described by the ν_e-Michel parameter ω_L.

6787 (LA-SUB–94-170) **Evaluation and compilation of fission product yields 1993.** England, T.R.; Rider, B.F. Los Alamos National Lab., NM (United States). [1995]. 173p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95003450. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the latest in a series of compilations of fission yield data. Fission yield measurements reported in the open literature and calculated charge distributions have been used to produce a recommended set of yields for the fission products. The original data with reference sources, and the recommended yields axe presented in tabular form. These include many nuclides which fission by neutrons at several energies. These energies include thermal energies (T), fission spectrum energies (F), 14 meV High Energy (H or HE), and spontaneous fission (S), in six sets of ten each. Set A includes U235T, U235F, U235HE, U238F, U238HE, Pu239T, Pu239F, Pu241T, U233T, Th232F. Set B includes U233F, U233HE, U236F, Pu239H, Pu240F, Pu241F, Pu242F, Th232H, Np237F, Cf252S. Set C includes U234F, U237F, Pu240H, U234HE, U236HE, Pu238F, Am241F, Am243F, Np238F, Cm242F. Set D includes Th227T, Th229T, Pa231F, Am241T, Am241H, Am242MT, Cm245T, Cf249T, Cf251T, Es254T. Set E includes Cf250S, Cm244S, Cm248S, Es253S, Fm254S, Fm255T, Fm256S, Np237H, U232T, U238S. Set F includes Cm243T, Cm246S, Cm243F, Cm244F, Cm246F, Cm248F, Pu242H, Np237T, Pu240T, and Pu242T to complete fission product yield evaluations for 60 fissioning systems in all. This report also serves as the primary documentation for the second evaluation of yields in ENDF/B-VI released in 1993.

6788 (LA-UR–94-3727) **The nuclear spin-isospin response to quasifree nucleon scattering.** Taddeucci, T.N. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9409103–7: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95003722. Source: OSTI; NTIS; INIS; GPO Dep.

The Neutron-Time-of-Flight (NTOF) facility at LAMPF has been used to measure complete sets of polarization-transfer coefficients for quasifree $(\vec{p},\vec{n})$ scattering from ^{2}H, ^{12}C, and ^{40}Ca at 494 MeV and scattering angles of 12.5°, 18°, and 27° (q = 1.2, 1.7, 2.5 fm^{-1}). These measurements yield separated transverse ($\sigma \times q$) and longitudinal ($\sigma \cdot q$) isovector spin responses. Comparison of the separated responses to calculations and to electron-scattering responses reveals a strong enhancement in the spin transverse channel. This excess transverse strength masks the effect of pionic correlations in the response ratio.

6789 (LA-UR–94-3744) **Second generation interferometry measurements at CERN.** Sullivan, J.P. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9406291–1: 5. conference on the intersections of particle and nuclear physics, Tampa, FL (United States), 1-6 Jun 1994). Order Number DE95003724. Source: OSTI; NTIS; INIS; GPO Dep.

Source size parameters measured via two-particle interferometry in experiment NA44 for 200 GeV/nucleon S+Pb collisions are compared to calculations using the RQMD event generator. Reasonable agreement is found in most cases. The event generator is then used to compare the "true" size of the particle-emitting source to the measured size parameters and to discuss the difficulties in defining the "true" source size.

6790 (LA-UR–94-3967) **Pion and kaon freezeout in NA44.** NA44 Collaboration. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9406274–3: NATO Advanced Research workshop on hot hadronic matter: theory and experiment, Divonne-les-Bains (France), 27 Jun - 1 jul 1994). Order Number DE95003667. Source: OSTI; NTIS; INIS; GPO Dep.

The NA44 spectrometer is optimized for the study of single and two-particle particle spectra near mid-rapidity for transverse momenta below $\approx$ 1 GeV/c. A large fraction of all pairs in the spectrometer's acceptance are at low relative momenta, resulting in small statistical uncertainties on the extracted size parameters. In addition, the spectrometer's clean particle identification allows the authors to measure correlation functions for pions, kaons, and protons. This contribution will concentrate on the source size parameters determined from pion and kaon correlation functions. These size parameters will be compared to calculations from the RQMD event generator and also interpreted in the context of a hydrodynamic model. Finally, the measured single particle spectra will be examined from the viewpoint of hydrodynamics.

6791 (LBL–34831, pp. 49-60) **Space-time evolution of production of semihard QCD-quanta in ultrarelativistic heavy ion collisions.** Eskola, K.J. (Univ. of Helsinki (Finland)); Wang, Xin-Nian. Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors discuss the space-time evolution of initial parton production in ultrarelativistic heavy ion collisions within the framework of perturbative QCD. They use the uncertainty principle to address an average lifetime for a produced parton in terms of its energy and virtuality and consider the average duration of multiple independent semihard scatterings with initial and final state radiation. For central Au + Au collisions at $\sqrt{s}$ = 200 GeV, most of the partons are found to be produced within 0.5 fm/c after the total overlap of the two colliding nuclei. They also study the evolution of rapidity and momentum distributions, discuss the chemical composition of the formed semihard quark-gluon system and estimate when the system could reach momentum isotropy.

6792 (LBL–34831, pp. 61-72) **QCD based space-time description of high energy nuclear collisions.** Geiger, K. (Univ. of Minnesota, Minneapolis, MN (United States)). Lawrence Berkeley Lab., CA (United States). [1993]. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The current understanding of the early stage of heavy ion collisions at collider energies on the basis of the improved parton model and kinetic theory is presented. The space-time evolution of these reactions is investigated in terms of the dissipative dynamics of (semi)hard quark and gluon interactions within perturbative QCD. The partons' phase-space distributions are evolved in real time according to a transport equation through multiple collisions, emission and absorption processes. The resulting parton cascade picture is applied to study the issues of thermalization, chemical equilibration, and particle production in AA collisions at RHIC and LHC.

6793 (LBL–34831, pp. 313-320) **Exotic charmed baryon production in ultrarelativistic heavy ion collisions.** Zimanyi, J. (Central Research Institute for Physics, Budapest (Hungary)); Biro, T.S.; Levai, P. Lawrence Berkeley Lab., CA (United States). [1993]. Grant 2973. (CONF-9308181–: Pre-equilibrium Parton dynamics, Berkeley, CA (United States), 23 Aug - 3 sep 1993). In *Pre-equilibrium parton dynamics: Proceedings.* 361p. Source: OSTI; NTIS; INIS.

The authors investigate multi-heavy baryon formation in Au + Au collision using an extended version of the combinatoric break up model for rehadronization. A penalty factor, p, is introduced to characterize the coalescence probability of a light quark with a heavy one. At LHC energy large production rate is found for certain multi-heavy baryons and mesons such as Ω_{ccc}, Ξ_{cc}, J/Ψ and suppression for Λ_c, D. They speculate also on the possible existence of a heavy bottom-charm six-quark baryon. A semiclassical and a gaussian estimate reveal that the octet-octet bbb-cc configuration can be energetically favored with respect to the singlet-singlet one.

The primary motivation for studying nucleus-nucleus collisions at relativistic and ultrarelativistic energies is to investigate matter at high energy densities ($\varepsilon \gg 1$ GeV/fm^3). Early speculations of possible exotic states of matter focused on the astrophysical implications of abnormal states of dense nuclear matter. Field theoretical calculations predicted abnormal nuclear states and excitation of the vacuum. This generated an initial interest among particle and nuclear physicists to transform the state of the vacuum by using relativistic nucleus-nucleus collisions. Extremely high temperatures, above the Hagedorn limiting temperature, were expected and a phase transition to a system of deconfined quarks and gluons, the Quark-Gluon Plasma (QGP), was predicted. Such a phase of matter would have implications for both early cosmology and stellar evolution. The understanding of the behavior of high temperature nuclear matter is still in its early stages. However, the dynamics of the initial stages of these collisions, which involve hard parton-parton interactions, can be calculated using perturbative QCD. Various theoretical approaches have resulted in predictions that a high temperature (T $\sim$ 500 MeV) gluon gas will be formed in the first instants (within 0.3 fm/c) of the collision. Furthermore, QCD lattice calculations exhibit a phase transition between a QGP and hadronic matter at a temperature near 250 MeV. Such phases of matter may have existed shortly after the Big Bang and may exist in the cores of dense stars. An important question is whether such states of matter can be created and studied in the laboratory. The Relativistic Heavy Ion Collider (RHIC) and a full

complement of detector systems are being constructed at Brookhaven National Laboratory to investigate these new and fundamental properties of matter.

6796 (LBL–36299) **Spin polarization of ^{23}Mg in ^{24}Mg + Au, Cu and Al collisions at 91 A MeV.** Matsuta, K. (Osaka Univ., Osaka (Japan)); Fukuda, S.; Izumikawa, T. Lawrence Berkeley Lab., CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC03-76SF00098. NASA Grant NGT-50783. (CONF-9409103–6: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95003419. Source: OSTI; NTIS; INIS; GPO Dep.

Spin polarization of beta-emitting fragment ^{23}Mg(I^{π} = 3/2$^+$, $T_{1/2}$ = 11.3 s) produced through the projectile fragmentation process in ^{24}Mg + Au, Cu and Al collisions has been observed at 91 A MeV. General trend in the observed momentum dependence of polarization is reproduced well qualitatively by a simple fragmentation model based on the participant-spectator picture, for heavy and light targets. However the polarization behavior differs from this model in terms of zero crossing momentum, which become prominent in the case of Cu target, where the polarization is not monotone function of the fragment momentum.

6797 (LUNFD6-NFFR–1011/1-169(1994)) **High resolution (γ, n) experiments in light nuclei at $E_\gamma \simeq$ 60 MeV.** Andersson, Bengt Erik. Lund Univ. (Sweden). Dept. of Nuclear Physics. 30 Sep 1994. 186p. Order Number DE95610405. Source: OSTI; NTIS; INIS.

The experiments was undertaken to establish the real photon reaction mechanism on light nuclei in the intermediate photon-energy region. The shortage of high quality (γ, n) data was the main motivation for starting a systematic investigation of this reaction channel. In this work, ^{12}C and ^{16}O were examined. Two neutron detector arrays were built and tested. A state-of-the-art neutron spectrometer was constructed by combining these arrays with a high resolution ($\simeq$ 300 keV) photon tagger. The intrinsic time resolution of this spectrometer ($\simeq$ 800 ps) allowed an excellent neutron energy resolution to be achieved ($\simeq$ 1 MeV) with fairly short flight paths ($\simeq$ 6 m), thereby optimizing the geometrical efficiency ($\simeq$ 10 msr) of the apparatus. The excellent energy resolution of the spectrometer allowed individual states (or cluster of states) to be resolved. This resolution approaches that available for the (γ, p) reaction. For ^{12}C and ^{16}O the same states seen in the (γ, p) reaction were observed over an angular range from 30-115 degrees. The most important result, concerning the obtained absolute differential cross sections, is the striking similarity between the (γ, p) and (γ, n) reaction channels. This applies to both target nuclei for all populated states, independent of character (1h or 2h1p). A much detailed comparison is thus possible with these new data, providing greater constraints on the theoretical models. Further, access to more and better data will hopefully attract greater theoretical interest. The experiment was a collaboration between the Photonuclear research group at Lund University in Sweden and the Nuclear structure group from the University of Glasgow. The data were collected at MAX-lab in Lund, Sweden. 96 refs, 105 figs, 28 tabs.

6798 (INIS-RU–379, pp. 34-36) **Evaluation of the Bragg law fluctuation at the calculation of proton slowing-down in SiO_2.** Aleksandrov, V.A.; Filippov, G.M. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

In simple examples with SiO_2 crystal the Bragg law is shown to increase the value of energy losses by particles moving in matter. The Bragg law fluctuations, reaching at low energies 20-30% with further proton energy increase, decrease gradually and they make up less than 2-3% for E_p > 600 keV. The importance of taking into account polarization of frames in dielectrics is pointed out. 2 refs., 2 figs.

In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Based on microscopic quantum field theory, polarization field fluctuations are calculated for a fast nonrelativistic charged particle moving from vacuum into the bulk solid and for a relativistic particle with the allowance for transverse modes. The derived formula is applicable to vacuum where it turns the values of polarization field fluctuations to zero. 4 refs.

6800 (INIS-RU–379, pp. 43-45) **Stopping power of solid absorbers for nitrogen and carbon ions in the range of maximum stopping power curve.** Mayatskij, V.D.; Chesnokova, T.D. Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The results of theoretical and experimental studies of energy dependence of cross sections for coherent e^+e^- pair production (at equal e^+ and e^- energies) in <100> Si crystal are presented. There is a maximum in the energy spectra at E_{ph}=260 MeV. The width and form of the maximum can be explained by the channeling effect on coherent type-B pair production. 7 refs., 2 figs.

6803 (INIS-RU–379, pp. 64-66) **Calculation of radiation and pair production probabilities at arbitrary incidence angles to crystal planes.** Tikhonirov, V.V. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The results of calculations of the intensity and polarization of radiation from channeled and unchanneled $e^{+-}$are presented. The Fourier transformation (FT) is used to calculate numerous matrix elements. The calculations for channeled e^+ showed fast approach of spectral intensity to its value calculated in the approximation of self-consistent field (ASCF) with growing photon energy. In the case of 150 GeV unchanneled e^- in <110> Ge at T=293 K the ASCF gives a significantly higher value as compared to the FT. 4 refs., 3 figs.

6804 (INIS-RU–379, pp. 79-81) **Comparison of diffraction intensity of bremsstrahlung photons and parametric X-radiation.** Verzilov, V.A.; Kalinin, B.N.; Potylitsyn, A.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

To compare the contributions from parametric X-radiation and diffraction bremsstrahlung, measurements are carried out of orientation dependences (OD) of photon emission for 900, 600 and 300 MeV electrons in silicon monocrystal. Whereas for 900 and 600 MeV case the calculations describe the experiment well, for 300 MeV electrons there is evidence for inconsistent form of OD which indicates the contribution of real photon diffraction. 5 refs.; 1 fig.; 1 tab.

6805 (JAERI-M–94-019, pp. 20-24) **Study of nuclear data in Indonesia.** Lasijo, R.S. (National Atomic Energy Agency, Jakarta (Indonesia)); Aziz, F.; Santoso, B.; Subki, I.R. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

A team for the installation of the evaluated nuclear data libraries has been formed. The team is expected to be the embryo for the formation of the nuclear data group in Indonesia. The first task of the team was to install the evaluated nuclear data libraries ENDF through the IAEA technical assistance. Experts from the IAEA have been sent to Indonesia to help the installation of the libraries together with the preprocessing and the processing codes, and to train the local scientists on the applications of several codes. Utilization of evaluated nuclear data in nuclear reactor core calculations is the most concerned objective in the moment. Applications in other fields like radiation protection and shielding, nuclear medicine, etc., may follow. The possibilities of working on the nuclear data measurements and evaluations are also considered. (author).

6806 (JAERI-M–94-019, pp. 159-161) **Environment of nuclear energy development and international cooperation of nuclear data activity.** Fuketa, Toyojiro (Nuclear Energy Data Center, Tokai, Ibaraki (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

The world nuclear data activity achieved a reasonable level in the 1980's, and the power reactor development should have been given a stimulus. But, unfortunately the Chernobyl accident happened on 26th April 1986, since then the world nuclear energy development has been suffering from a very serious adverse wind, and governmental supports to the nuclear data activities in most countries have been declining also. It is clear for us that nuclear fission is the best major energy source for the preservation of the global environment in the foreseeable long future. More accurate nuclear data and hitherto unavailable kind of nuclear data are requisite for an advanced nuclear research and development. Under the existing circumstances of the nuclear data activity, an increased effort for the international cooperation in the nuclear data field is indeed required. (author).

6807 (JAERI-M–94-019, pp. 276-289) **Reevaluation of FP nuclear data for JENDL-3.2.** Kawai, M. (Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

Reevaluation of the nuclear data for about 60 fission product nuclides has been made for JENDL-3.2, taking accounts of the new experimental data and the results of integral tests for JENDL-3. As for thermal cross sections of long lived nuclides, JRR-4 measurements at JAERI were adopted. Major part of the revision of the resonance parameters were made according to the renormalization of the experimental capture-area data of ORNL. Capture cross sections were renormalized so as to reduce the contradiction between the differential and the integral data. For some nuclides, the optical model parameters were revised to improve the energy dependence of total and capture cross sections. Direct components were added to the inelastic scattering cross sections of Zr and Mo isotopes. As for deformed nuclides such as Sm and Nd isotopes, the coupled channel calculation was made for estimation of excitation functions of rotational levels. (author).

This report contains papers on the following topics: present status of SPring-8 and the atomic physics undulator beamline; recent photoabsorption measurements in the rare gases and alkalis in the 3 to 15 keV proton energy region; atomic and molecular physics at LURE; experiments on atoms, ions and small molecules using the new generation of synchrotron radiation sources; soft x-ray fluorescence spectroscopy using tunable synchrotron radiation; soft x-ray fluorescence spectroscopy excited by synchrotron radiation: Inelastic and resonant scattering near threshold; outer-shell photoionization of ions; overview of the APS BESSRC beamline development; the advanced light source: Research opportunities in atomic and molecular physics; Photoionization of the Ba^+ ion by 4d shell excitation; decay dynamics of inner-shell excited atoms and molecules; absorption of atomic Ca, Cr, Mn and Cu; High-resolution photoelectron studies of resonant molecular photoionization; radiative and radiationless resonant raman scattering by synchrotron radiation; auger spectrometry of atoms and molecules; some thoughts of future experiments with the new generation of storage rings; Electron spectroscopy studies of argon

K-shell excitation and vacancy cascades; ionization of atoms by high energy photons; ion coincidence spectroscopy on rare gas atoms and small molecules after photoexcitation at energies of several keV; an EBIS for use with synchrotron radiation photoionization of multiply charged ions and PHOBIS; gamma-2e coincidence measurements the wave of the future in inner-shell electron spectroscopy; recoil momentum spectroscopy in ion-atom and photon-atom collisions; a study of compton ionization of helium; future perspectives of photoionization studies at high photon energies; and status report on the advanced photon source. These papers have been cataloged separately elsewhere.

6809 (DOE/ER/13394–T3) **Studies of autoionizing states relevant to dielectronic recombination. Progress report, July 1, 1991–June 30, 1994.** Gallagher, T.F. Virginia Univ., Charlottesville, VA (United States). Dept. of Physics. Dec 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13394. Order Number DE94014162. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this research program supported by grant DE-FG05-85-ER13394 is to study the properties of autoionizing states to understand in detail dielectronic recombination of ions and electrons. During the period of the present grant, July 1, 1991–June 30, 1994, we have put substantial effort into the study of autoionizing states in Mg. The first topic we have investigated is the angular distribution of electrons ejected from the autoionizing Mg 3pns and 3pnd states. Both of these sets of measurements provide more stringent tests of the K matrix calculations than do measurements of total cross sections. The second topic is the effect of static and microwave electric fields on autoionizing states. Our previous measurements in Ba have shown the profound influence of electric fields on autoionization rates and we have made extensive new measurements in both Ba and Mg. Electric fields are of real importance for dielectronic recombination, since they are present as macroscopic fields in beam experiments and as microfields in plasmas. Finally, we have begun time resolved measurements. We have set up a picosecond laser system, and we have just finished the first experiment with it. Specifically we have used picosecond excitation from a bound Mg 3pnd Rydberg wave packet to the autoionizing 3pnd states to show explicitly the correlation between the spatial location of the Rydberg electron and the frequency of the exciting light.

The advent of supercomputers with many computational nodes each with its own independent memory makes possible extremely fast computations. The author's work, as part of the US High Performance Computing and Communications Program (HPCCP), is focused on the development of electronic structure techniques for the solution of Grand Challenge-size molecules containing hundreds of atoms. Their efforts have resulted in a fully scalable Direct-SCF program that is portable and efficient. This code, named NWCHEM, is built around a distributed-data model. This distributed data is managed by a software package called Global Arrays developed within the HPCCP. They present performance results for Direct-SCF calculations of interest to the consortium.

The FORTRAN 77 code PHOTAC to compute photon attenuation coefficients of elements and compounds is described. The code is based on the semi-analytical approximate atomic cross sections proposed by Baro et al. (1994). Photoelectric cross sections are calculated directly from a simple analytical expression. Atomic cross sections for coherent and incoherent scattering and for pair production are obtained as integrals of the corresponding differential cross sections. These integrals are evaluated, to a pre-selected accuracy, by using a 20-point Gauss adaptive integration algorithm. Calculated attenuation coefficients agree with recently compiled databases to within equal 1%, in the energy range from 1 KeV to 1 GeV. The complete source listing of the program PHOTAC is included.

6812 (PNL–10203) **Krypton isotope analysis using near-resonant stimulated Raman spectroscopy.** Whitehead, C.A.; Cannon, B.D.; Wacker, J.F. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005061. Source: OSTI; NTIS; INIS; GPO Dep.

A method for measuring low relative abundances of ^{85}Kr in one liter or less samples of air has been under development here at Pacific Northwest Laboratory. The goal of the Krypton Isotope Laser Analysis (KILA) method is to measure ratios of 10^{-10} or less of ^{85}Kr to more abundant stable krypton. Mass spectrometry and beta counting are the main competing technologies used in rare-gas trace analysis and are limited in application by such factors as sample size, counting times, and selectivity. The use of high-resolution lasers to probe hyperfine levels to determine isotopic abundance has received much attention recently. In this study, we report our progress on identifying and implementing techniques for trace ^{85}Kr analysis on small gas samples in a static cell as well as limitations on sensitivity and selectivity for the technique. High-resolution pulsed and cw lasers are employed in a laser-induced fluorescence technique that preserves the original sample. This technique, is based on resonant isotopic depletion spectroscopy (RIDS) in which one isotope is optically depleted while preserving the population of a less abundant isotope. The KILA method consists of three steps. In the first step, the $1s_5$ metastable level of krypton is populated via radiative cascade following two-photon excitation of the $2p_6$ energy level. Next, using RBDS, the stable krypton isotopes are optically depleted to the ground state through the $1s_4$ level with the bulk of the ^{85}Kr population being preserved. Finally, the remaining metastable population is probed to determine ^{85}Kr concentration. The experimental requirements for each of these steps are outlined below.

6813 (GSI–94-57(prepr.)) **Doppler-shift assisted fast ion spectroscopy: a case study for X-ray emission from 277 MeV/u Pb^{81+} ions.** Mokler, P.H.; Stoehlker, T.; Kozhuharov, C.; Moshammer, R.; Rymuza, P.; Stachura, Z.; Warczak, A. Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany). Sep 1994. 27p. Order Number DE95725942. Source: OSTI; NTIS (US Sales Only); INIS.

Utilizing the different information from spatially separated segments of high-granular photon detectors the measured (LAB) energy of photons emitted by fast moving ions can be corrected individually for the Doppler effect according to the particular observation angles of each detector segment. By a redundant fitting procedure the center of mass photon energy can be determined with high precision. This new Doppler-shift assisted spectroscopy is explained for the case study of 277.4 MeV/u Pb^{82+} ions colliding with a N_2-gas target at the heavy ion storage ring ESR. Spectroscopic information for hydrogenic Pb^{81+} ions is given for the ground-state transitions, for the Balmer transitions, as well as for the total K-binding energy. (orig.)

6814 (LBL–36080) **A discrete variable representation for electron-hydrogen atom scattering.** Gaucher, L.F. Lawrence Berkeley Lab., CA (United States). Aug 1994. 152p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003436. Source: OSTI; NTIS; INIS; GPO Dep.

A discrete variable representation (DVR) suitable for treating the quantum scattering of a low energy electron from a hydrogen atom is presented. The benefits of DVR techniques (e.g. the removal of the requirement of calculating multidimensional potential energy matrix elements and the availability of iterative sparse matrix diagonalization/inversion algorithms) have for many years been applied successfully to studies of quantum molecular scattering. Unfortunately, the presence of a Coulomb singularity at the electrically unshielded center of a hydrogen atom requires high radial grid point densities in this region of the scattering coordinate, while the presence of finite kinetic energy in the asymptotic scattering electron also requires a sufficiently large radial grid point density at moderate distances from the nucleus. The constraints imposed by these two length scales have made application of current DVR methods to this scattering event difficult.

6815 (UCRL-JC–117932) **Toward improved photon-atom scattering predictions.** Kissel, L. Lawrence Livermore National Lab., CA (United States). 21 Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941129–10: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95003651. Source: OSTI; NTIS; INIS; GPO Dep.

Photon-atom scattering is important in a variety of applications, but scattering from a composite system depends on the accurate characterization of the scattering from an isolated atom or ion. We have been examining the validity of simpler approximations of elastic scattering in the light of second-order S-matrix theory. Partitioning the many-body amplitude into Rayleigh and Delbrueck components, processes beyond photoionization contribute. Subtracted cross sections for bound-bound atomic transitions, bound pair annihilation, and bound pair production are required in anomalous scattering factors for: (1) convergence of the dispersion integral; (2) agreement with predictions of the more sophisticated S-matrix approach; (3) satisfying the Thomas-Reiche-Kuhn sum rule. New accurate tabulations of anomalous scattering factors have been prepared for all Z, for energies 0–10,000 keV, within the independent particle approximation (IPA) using a Dirac-Slater model of the atom. Separately, experimental atomic photoabsorption threshold information has been used to modify these IPA predictions for improved comparison with experiment.

6816 (LBL–36079) **Study of radicals, clusters and transition state species by anion photoelectron spectroscopy.** Arnold, D.W. Lawrence Berkeley Lab., CA (United States). Aug 1994. 481p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95003438. Source: OSTI; NTIS; INIS; GPO Dep.

Free radicals, elemental and van der Waals clusters and transition state species for bimolecular chemical reactions are investigated using anion photoelectron spectroscopy. Several low-lying electronic states of ozone have been identified via photoelectron spectroscopy of O_3^-. A characterization of these states is important to models for atmospheric ozone reaction kinetics. The fluoroformyloxyl radical, FCO_2, has been investigated, providing vibrational frequencies and energies for two electronic states. The technique has also been employed to make the first direct observation and characterization of the NNO_2 molecule. Several electronic states are observed for this species which is believed to play a role as a reactive intermediate in the $N + NO_2$ reaction. The experimental results for all three of these radicals are supplemented by ab initio investigations of their molecular properties. The clusters investigations include studies of elemental carbon clusters ($C_2^- - C_{11}^-$), and van der Waals clusters ($X^-(CO_2)_n$, X = I, Br, Cl; $n \leq 13$ and $I^- (N_2O)_{n=1--11}$). Primarily linear clusters are observed for the smaller carbon clusters, while the spectra of the larger clusters contain contribution from cyclic anion photodetachment. Very interesting ion-solvent interactions are observed in the $X^-(CO_2)n$ clusters. The transition state regions for several bimolecular chemical reactions have also been investigated by photodetachment of a negative ion precursor possessing a geometry similar to that of the transition state species. These spectra show features which are assigned to motions of the unstable neutral complex existing between reactants and products.

6817 (UCRL-JC–117928) **Na-like autoionizing levels: Plasma diagnostics and prospects for photopumped soft x-ray lasers.** Osterheld, A.L. (and others); Dunn, J.; Young, B.K.F. Lawrence Livermore National Lab., CA (United States). Aug 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940592–10: 4. international colloquium on X-ray lasers, Williamsburg, VA (United States), 16-20 May 1994). Order Number DE95004207. Source: OSTI; NTIS; GPO Dep.

We have investigated the kinetics of doubly excited sodium-like copper states with $3131'$ and $3141'$ configurations, and the feasibility of photopumped x-ray lasing schemes and plasma diagnostics using transitions from these levels. These x-ray lasing schemes, like similar lasing schemes in Li-like ions, have high quantum efficiency and potentially reduced radiative trapping effects. In addition, the satellite transitions emitted by these sodium-like levels may provide valuable diagnostics of x-ray laser plasmas.

Order Number DE94018900. Source: OSTI; NTIS; GPO Dep.

In this paper, we discuss experimental, analytical, and computational techniques for studying the high velocity interaction of solid bodies with low density media. We assume that the velocity of the interaction is such that compressible effects in the solid are important. We are particularly interested in the dynamic mechanisms of deformation, erosion, and breakup which dominate the solid response at these high velocities. This is a problem of considerable current interest. Applications include the atmospheric propagation of high velocity aerosols, such as those that might be created in certain kinds of nuclear reactor accidents and explosive weapon accidents. An even more novel application is to the study of the impact of astrophysical bodies, such as meteors, asteroids, and comet fragments into planetary atmospheres. There is significant concern over the threats posed by impacts of these kinds on the earth. We will discuss the application of our methodology to understanding these impacts. In particular, we suggest that the experimental technique we present is applicable to scaled laboratory

simulations of some of the phenomena that are believed to be important in atmospheric impacts.

The possibility of determination of oxygen content both in the surface and in the bulk of HTcSC $YBa_2Cu_3O_x$ ceramics is realized using the $^{16}O(d, \alpha)^{14}N$ reactions. The energy of alpha particles indicates the depth of the damaged layer, and the quantity of alpha particles indicates oxygen concentration in the layer. 6 refs.; 1 fig.; 1 tab.

6825 (INIS-RU–379, pp. 158-160) **Crystal structure of multilayered HTSC films investigated by the method of mean energy ion scattering.** Afrosimov, V.V.; Dzyuba, G.O.; Il'in, R.N.; Karmanenko, S.F.; Panov, M.N.; Sakharov, V.I.; Serenkov, I.T.; Chakalov, R. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Using mean energy ion channeling the disorientation value $\delta \simeq 0.9$ in $YBa_2Cu_3O_{6+\delta}$ films and a share of polycrystalline phase are determined. The calculation for 230 keV protons gives the value $\chi \simeq 0.2$, where χ is a relative ion yield in the absence of disordering, which gives evidence for a polycrystalline phase in the film. 2 refs.; 4 figs.

6826 (INIS-RU–379, pp. 164-166) **Reconstruction of impurity concentration profile by the resonance nuclear reaction method.** Zabashta, O.I.; Kul'ment'ev, A.I.; Nesterenko, A.E.; Storizhko, V.E.; Dikij, N.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Impurity concentration profile (ICP) is determined in molybdenum doped with 10 keV argon ions by solving the integral equation. The reconstruction of the ICP is carried out from the $^{40}Ar(p, \alpha\gamma)$ reaction yield. Argon concentration maximum is found to the depth $\approx$10 mkg/cm^2. 2 refs.; 1 fig.

6827 (INIS-RU–379, pp. 167-169) **Estimation of the degree of authenticity of concentrational element profile derived from RBS measurements.** Egorov, V.K.; Okhulkov, A.V. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A simple technique is offered for estimating the degree of authenticity of element concentrational profile which does not depend on the complicated character of RBS spectra and possible intercorrelation of parameters. The technique can be implemented with any program simulating RBS spectra, for instance, RUMP. 5 refs.; 1 fig.; 1 tab.

6828 (LA-UR–94-3872) **Phonon characteristics of high T_c superconductors from neutron Doppler broadening measurements.** Trela, W.J. (Los Alamos National Lab., NM (United States)); Kwei, G.H.; Lynn, J.E.; Meggers, K. Los Alamos National Lab., NM (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941144–14: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95003703. Source: OSTI; NTIS; INIS; GPO Dep.

Statistical information on the phonon frequency spectrum of materials can be measured by neutron transmission techniques if they contain nuclei with low energy resonances, narrow enough to be Doppler-broadened, in their neutron cross sections. The authors have carried out some measurements using this technique for materials of the lanthanum barium cuprate class, $La_{2-x}Ba_xCuO_4$. Two samples with slightly different concentrations of oxygen, one being superconductive, the other not, were examined. Pure lanthanum cuprate was also measured. Lanthanum, barium and copper all have relatively low energy narrow resonances. Thus it should be possible to detect differences in the phonons carried by different kinds of atom in the lattice. Neutron cross section measurements have been made with high energy resolution and statistical precision on the 59m flight path of LANSCE, the pulsed spallation neutron source at Los Alamos National Laboratory. Measurements on all three materials were made over a range of temperatures from 15K to 300K, with small steps through the critical temperature region near 27K. No significant changes in the mean phonon energy of the lanthanum atoms were observed near the critical temperature of the super-conducting material. It appears however that the mean phonon energy of lanthanum in the superconductor is considerably higher than that in the non-superconductors. The samples used in this series of experiments were too thin in barium and copper to determine anything significant about their phonon spectra.

In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Coulomb excitation (CE) of ^{19}F nuclei in LiF crystals by protons and antiprotons is considered, in particular the difference in the cross sections of CE determined by crystal orientation. It is shown that at disorientation of proton/antiproton beams relative to a crystal axis, orientational dependence of CE cross sections occurs. The difference in CE cross section is only related with the allowance for Coulomb repulsion at low energies. 3 refs.

A possibility of positron-like electron channeling during axial motion of relativistic electrons in one-domain ferro- and antiferromagnetic crystals is investigated. The problem is analyzed by using the Klein-Gordon equation. Analysis shows that the most attractive for channeling are antiferromagnetic structures, where there is almost a parabolic potential well. The depth of the potential magnetic wells and barriers in interaxial space for rare earth magnetics can attain 1 eV. 1 ref., 1 fig.

6835 (INIS-RU–379, pp. 20-22) **Acoustic analysis of the efficiency of beam deflection by a bended crystal.** Denisov, F.P.; Il'in, S.I.; Potylitsyn, A.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The acoustic method of determination of the efficiency of charged particle beam deflection by a bended crystal is discussed. The method relies on measurement of the amplitude of an acoustic signal excited by channeling particles. The sensitivity of the method for 10 TeV proton beams is estimated. It made up about 10^6 particles per pulse. 7 refs.

6836 (INIS-RU–379, pp. 23-25) **Antiproton channeling.** Grankina, T.V.; Pokhil, G.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A share of channeled antiprotons suffered abnormally small losses and whose penetration depth is longer than their range is analyzed. Bound 4 MeV protons moving along the <100> Si axis are investigated. The energy spectrum of antiprotons penetrated at the level of 200 μkm has only shown the emission of axially channeling particles having energy $\approx$2.5 MeV. Particles not channeling have the range $\approx$160 μkm and they stop moving in the crystal. 3 refs., 4 figs.

6837 (INIS-RU–379, pp. 26-28) **Interaction of oxygen ions with the crystal lattice of Si-detector at channeling.** Eremin, V.K. (AN SSSR, Leningrad (Russian Federation). Fiziko-Tekhnicheskij Inst.); Medvedev, L.S.; Strokan, N.B.; Kobzev, A.P.; Shirokov, D.M. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility of investigation of elastic scattering, atom ionization is analyzed using Si-detector as a target at oxygen ion channeling. Amplitude spectra were detected for various incidence angles of 1.5 and 2.0 MeV oxygen ions. 60 keV amplitude shift for oxygen and 50% reduction in half widths for a channeling peak are determined. 5 refs., 1 fig.

6838 (INIS-RU–379, pp. 29-31) **Energy dependence of the intensity of backscattering of fast electrons by highly symmetric crystals.** Makarov, V.V.; Solov'ev, S.V.; Pavlov, D.A. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Nonmonotonous energy dependence of the intensity of 10 keV electron backscattering I(E) during irradiation of highly oriented silicon crystal is calculated. The calculations showed that in some cases on the curves I(E) there can be seen narrow $\approx$10 eV peaks the value of which grows with growing temperature. 3 refs., 2 figs.

6839 (INIS-RU–379, pp. 32-33) **A new technique for analyzing crystal structures by electron channeling image processing.** Makarov, V.V.; Solov'ev, S.V.; Pavlov, D.A. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A technique is developed for computer-aided processing of electron channeling images. The technique enables three-dimensional analysis of the structure of the reciprocal crystal lattice and it ensures measurement of the backscattering intensity which corresponds to its lattice points. The technique is suggested to be used in investigation of defect formation at ion implantation. 1 fig.

6840 (INIS-RU–379, pp. 40-42) **Changes in electrophysical properties of silicon at multistep ion implantation.** Volod'ko, V.G.; Tkach, B.Ya.; Lesnikov, V.P.; Mazur, O.I. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The paper is aimed at revealing long-range interaction using a special means of ion implantation which implements stepwise irradiation of a rotating substrate open to an ion beam from both sides (the front and back). The substrates were irradiated with 40 keV Ar, N, P ions. There was a strong evidence for an amorphous phase at the depth of 1400 A in the irradiated plates of monocrystalline silicon and a polycrystalline phase at the depth of 2000 A. 3 refs.

6841 (INIS-RU–379, pp. 46-48) **Calculation of ion depth distribution at axial channeling with the allowance for multiple scattering and energy loss fluctuations.** Samarin, V.V. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The method of multiple scattering and energy loss fluctuations at calculation of ion depth distribution in amorphous material is extended to the case of axial ion channeling. The calculations of phosphorous, aluminium and calcium ions with the energies from 50 to 400 keV at their axial channeling in silicon are in good agreement with the experimental data. 4 refs., 2 figs.

6842 (INIS-RU–379, pp. 67-69) **On the possibility of one-frequency quasicharacteristic radiation generation at coherent channeling in crystals.** Vysotskij, V.I.; Kuz'min, R.N.; Maksyuta, N.V. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A possibility of generation of quasi-characteristic radiation with only one discrete line in X-radiation spectrum is considered for the case of coherent relativistic particle (electrons) channeling with full self-suppression of other discrete and continous lines in the usual quasi-characteristic radiation spectrum. 2 refs.

6843 (INIS-RU–379, pp. 70-72) **A set of programs describing electromagnetic processes at relativistic particle motion in the periodic potential of crystal field.** Nichipor, I.V.; Feranchuk, I.D.; Ul'yanenkov, A.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged

particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

A set of programs is suggested to calculate band and radiation spectra from the Schroedinger equation with an arbitrary periodical potential defining the channeling relativistic particles (E=1-500 MeV). The program takes into account the radiation spectrum formation by summing up supbarrier, subbarier and intermediate energy-level transitions. It enables an approximate calculation of dechanneling processes. 5 refs.

6844 (INIS-RU–379, pp. 73-76) **Distortions in B-type coherent bremsstrahlung spectra of channeling relativistic electrons.** Amosov, K.Yu.; Balayan, A.S.; Vnukov, I.E.; Kalinin, B.N.; Naumenko, G.A.; Potylitsyn, A.P.; Sarychev, V.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Relations and differences between the two mechanisms of gamma quanta generation by electrons (E=100-200 MeV) in <100> diamond monocrystals: coherent bremsstrahlung (CB) and radiation at channeling are revealed. The 'splitting' in the peak of the spectrum due to electron channeling is discovered. The CB process can be used for production of quasimonochromatic photon beams. 9 refs.; 4 figs.

6845 (INIS-RU–379, pp. 77-78) **Study of positron beam production at electron channeling in tungsten.** Amosov, K.Yu.; Balayan, A.S.; Vnukov, I.E.; Kalinin, B.N.; Naumenko, G.A.; Potylitsyn, A.P.; Sarychev, V.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Spectra of positrons generated of 900 MeV electron-induced radiation in tungsten and tantalum monocrystals are measured. Because of high intensity and narrow focus of radiation at electron channeling the positron emission in the energy range 4-20 MeV for an oriented crystal is 3-4 times higher than it is for a disoriented one. With growing positron energy the yield ratio decreases up to 1 at positron energy E=80-90 MeV and it becomes less than 1 at higher energies. 6 refs.; 1 fig.

6846 (INIS-RU–379, pp. 87-89) **Diffusion of boron implanted into silicon irradiated by high-energy argon ions.** Varichenko, V.S.; Didyk, A.Yu.; Zajtsev, A.M.; Kazyuchits, N.M.; Kudelevich, N.A.; Chelyadinskij, A.R. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The diffusion of 100 keV boron ions implanted into Si irradiated by high-energy (46,3 MeV) Ar ions is investigated. Ar^+ ion implantation is shown to result in a 12 mkm surface defective layer where there is a 'plato' at the depth of 5 mkm and then defect concentration growth with the depth was seen. The absence of defect influence on the impurity re-distribution indicates the possible use of high-energy ion doping together with ion implantation at ordinary energies of ion beams within one technological cycle. 3 refs.; 3 figs.

6847 (INIS-RU–379, pp. 90-92) **Accumulation of radiation defects in silicon at high-energy ion implantation.** Varichenko, V.S.; Didyk, A.Yu.; Zajtsev, A.M.; Kazyuchits, N.M.; Mel'nikov, A.A.; Skuratov, V.A.; Chelyadinskij, A.R. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation defect depth distribution in the destructed layer, defect formation and annealing in the surface layer of Si crystals implanted with 1 MeV Ne^+, Ar^+ and Kr^+ ions at room temperature are investigated. A similar picture of defect formation is shown: the defect concentration increase decrease in defect formation rate at a certain typical of each ion dose. 2 figs.

6848 (INIS-RU–379, pp. 93-95) **Defect formation in silicon irradiated by high-energy argon ions.** Azarko, I.I.; Varichenko, V.S.; Kazyuchits, N.M.; Penina, N.M.; Tolstykh, V.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The EPR method was used to study the peculiarities of paramagnetic defect formation in silicon irradiated by 47 MeV Ar^+ ions. Spectral analysis has shown the formation of point defects (PD) and isolated amorphous domains (AD). The formation of AD occured due to maximum accumulation of PD in the 12 mkm layer and due to the formation of AD immediately in the domain of defect accumulation. 3 refs.; 3 figs.

6849 (INIS-RU–379, pp. 96-98) **Influence of ion flux density and irradiation time on the long-range interaction effect.** Sorvina, V.P.; Tetel'baum, D.I. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The effects of irradiation time (argon 40 keV ions) and ion flux density (j) on silicon microhardness on the opposite to the irradiated side of silicon plate and, cosequently, on the behavior of defects in semiconductor's layer adjacent to the unirradiated surface were studied. Measurements were carried out under the load of 20 G. It is shown that the higher ion flux density, the more probable dislocation-type defect formation is. At small values of j microhardness on the unshielded part of the plate is lower than it is on the shielded one. At great values of j the inverse relation takes place. 3 refs.; 2 figs.

6850 (INIS-RU–379, pp. 116-117) **Structural changes in GaAs doped with selenium ions.** Kaparov, S.E.; Kudyshev, A.N. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Relations and differences between the two mechanisms of gamma quanta generation by electrons (E=100-200 MeV) in <100> diamond monocrystals: coherent bremsstrahlung (CB) and radiation at channeling are revealed. The 'splitting' in the peak of the spectrum due to electron channeling is discovered. The CB process can be used for production of quasimonochromatic photon beams. 9 refs.; 4 figs.

6845 (INIS-RU–379, pp. 77-78) **Study of positron beam production at electron channeling in tungsten.** Amosov, K.Yu.; Balayan, A.S.; Vnukov, I.E.; Kalinin, B.N.; Naumenko, G.A.; Potylitsyn, A.P.; Sarychev, V.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Spectra of positrons generated of 900 MeV electron-induced radiation in tungsten and tantalum monocrystals are measured. Because of high intensity and narrow focus of radiation at electron channeling the positron emission in the energy range 4-20 MeV for an oriented crystal is 3-4 times higher than it is for a disoriented one. With growing positron energy the yield ratio decreases up to 1 at positron energy E=80-90 MeV and it becomes less than 1 at higher energies. 6 refs.; 1 fig.

6846 (INIS-RU–379, pp. 87-89) **Diffusion of boron implanted into silicon irradiated by high-energy argon ions.** Varichenko, V.S.; Didyk, A.Yu.; Zajtsev, A.M.; Kazyuchits, N.M.; Kudelevich, N.A.; Chelyadinskij, A.R. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The diffusion of 100 keV boron ions implanted into Si irradiated by high-energy (46,3 MeV) Ar ions is investigated. Ar^+ ion implantation is shown to result in a 12 mkm surface defective layer where there is a 'plato' at the depth of 5 mkm and then defect concentration growth with the depth was seen. The absence of defect influence on the impurity re-distribution indicates the possible use of high-energy ion doping together with ion implantation at ordinary energies of ion beams within one technological cycle. 3 refs.; 3 figs.

6847 (INIS-RU–379, pp. 90-92) **Accumulation of radiation defects in silicon at high-energy ion implantation.** Varichenko, V.S.; Didyk, A.Yu.; Zajtsev, A.M.; Kazyuchits, N.M.; Mel'nikov, A.A.; Skuratov, V.A.; Chelyadinskij, A.R. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation defect depth distribution in the destructed layer, defect formation and annealing in the surface layer of Si crystals implanted with 1 MeV Ne^+, Ar^+ and Kr^+ ions at room temperature are investigated. A similar picture of defect formation is shown: the defect concentration increase decrease in defect formation rate at a certain typical of each ion dose. 2 figs.

6848 (INIS-RU–379, pp. 93-95) **Defect formation in silicon irradiated by high-energy argon ions.** Azarko, I.I.; Varichenko, V.S.; Kazyuchits, N.M.; Penina, N.M.; Tolstykh, V.P. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The EPR method was used to study the peculiarities of paramagnetic defect formation in silicon irradiated by 47 MeV Ar^+ ions. Spectral analysis has shown the formation of point defects (PD) and isolated amorphous domains (AD). The formation of AD occured due to maximum accumulation of PD in the 12 mkm layer and due to the formation of AD immediately in the domain of defect accumulation. 3 refs.; 3 figs.

6849 (INIS-RU–379, pp. 96-98) **Influence of ion flux density and irradiation time on the long-range interaction effect.** Sorvina, V.P.; Tetel'baum, D.I. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. The effects of irradiation time (argon 40 keV ions) and ion flux density (j) on silicon microhardness on the opposite to the irradiated side of silicon plate and, cosequently, on the behavior of defects in semiconductor's layer adjacent to the unirradiated surface were studied. Measurements were carried out under the load of 20 G. It is shown that the higher ion flux density, the more probable dislocation-type defect formation is. At small values of j microhardness on the unshielded part of the plate is lower than it is on the shielded one. At great values of j the inverse relation takes place. 3 refs.; 2 figs.

6850 (INIS-RU–379, pp. 116-117) **Structural changes in GaAs doped with selenium ions.** Kaparov, S.E.; Kudyshev, A.N. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The investigation results on structural changes in ion-doped layer of GaAs are presented. The samples were doped with 450 keV Se^+ ions. Radiation dose and temperature dependences of the formation of clusters and dislocation loops in GaAs during its annealing are reported. 6 refs.

6851 (INIS-RU–379, pp. 118-120) **The effect of size-energy factor on mass transfer at ion implantation of two-layer films.**

Shpilevskij, Eh.M.; Kurilo, I.N. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Diffusion atomic flows of the two-layer Mo-Si film at the interface and at argon ion implantation are considered. A diffusion atomic flow is determined of the size-energy parameter γ, which characterises the location of implanted ion maximum. It is shown that the γ parameter has a significant effect on mass transfer and $MoSi_2$ and $MoSi_{0.65}$ phase growth. 3 refs.; 1 fig.; 1 tab.

6852 (INIS-RU–379, pp. 121-123) **Oxygen position in silicon.** Soroka, V.I.; Artsimovich, M.V.; Mogil'nik, M.F. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the paper is to clarify the position of oxygen in silicon by using 150 keV oxygen ion axial channeling and by annealing the sample at T=750 deg C. The position of oxygen was found out from IR absorption spectrum. The Si-O interatomic distance was found to be 1.20 A with the bond angle Si-O-Si equal to 153±4 deg. 5 refs.; 2 figs.

6853 (INIS-RU–379, pp. 124-127) **The influence of defect thermal stability on ion-induced crystallization.** Gusakov, G.A.; Novikov, A.P.; Komarov, F.F.; Tolstykh, V.P.; Akimov, A.N. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Variations in the spectrum of crystal defects induced by ion beams in silicon depending on substrate temperature in the process of silicon epitaxial growth (ion-induced crystallization IIC) are investigated. The samples were bombarded by P^+ ions at E=150 keV at T=20-450 deg C. It is shown that below 120 deg C the IIC process does not take place, because due to divacancy accumulation there is amorphization of Si near the interface. Temperatures above 125 deg C prevent the formation of VV-centers. 4 refs.; 2 figs.

6854 (INIS-RU–379, pp. 140-141) **Radiation defects and thermal stability of $A^{IV}B^{VI}$ films at proton irradiation.** Freik, D.M.; Salij, Ya.P.; Ruvinskij, M.A.; Voznyak, O.M.; Gorichok, I.Ya.; Dobrovol'skaya, A.M. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

The specific features of the annealing of radiation-induced defects in $Pb_{1-x}Sn_xTe$ films irradiated by 200-400 keV protons at 300 K and annealed at 310-450 K are determined. It is found that Frenkel pairs are the main defects of the films. The electric parameters of the films are completely restored at the temperatures 360-420 K. 3 refs.; 1 fig.

6855 (INIS-RU–379, pp. 144-146) **Internuclear axis orientation effects at molecular ion dissociation in metal surface.** Balashova, L.L. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of the 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Possible effects of internuclear axis orientation in energy spectra of dissociation products are studied from the point of view of the 'electron' dissociation mechanism. The calculations are carried out for H_2^+ dissociation at ion reflection by Al surface. The main qualitative result is the evidence for line narrowing in the energy spectrum of dissociation atom-products. 5 refs.; 2 figs.

6856 (LBL–35679) **Increasing the retained dose by plasma immersion ion implantation and deposition.** Anders, A.; Anders, S.; Brown, I.G.; Yu, Kin M. Lawrence Berkeley Lab., CA (United States). 22 Jul 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940731–3: 2. international conference on computer simulation of radiation effects, Santa Barbara, CA (United States), 24-29 Jul 1994). Order Number DE95003423. Source: OSTI; NTIS; INIS; GPO Dep.

The retained dose of ions can be increased by Plasma Immersion Ion Implantation and Deposition (PIIID). A substrate is immersed in a metal or carbon plasma and a negative repetitively pulsed bias voltage is applied. During the pulses, an electric sheath is formed around the substrate and ions are accelerated through the sheath and implanted into the substrate. Direct and recoil ion implantation and sputtering take place during the pulses whereas low-energy deposition occurs between the pulses. The condensable plasma can be produced using a cathodic arc plasma source combined with a magnetic macroparticle filter. PIIID can be applied to perform fast high-dose implantations or to deposit thin films with broad intermixing at the film-substrate interface. The bias voltage duty cycle can be tuned to sputter away the film deposited during pulse off-time (similar to the method of sacrificial layer). We have simulated the PIIID process using the Monte Carlo code T-DYN 4.0. This code allows a calculation of the dose-dependent depth profile for a process with deposition and implantation phases, taking sputtering into account. Predicted retained doses and experimentally obtained retained doses measured by Rutherford backscattering spectrometry are compared.

6654 Quantum Physics Aspects of Condensed Matter

6857 (CONF-940847–4) **The effect of magnetic field on the edge plasmons of two-dimensional electron gas systems.** Xia, X. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy); Chen, X.M.; Quinn, J.J. Oak Ridge National Lab., TN (United States); Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy. Jul 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on the application of high magnetic fields; Cambridge, MA (United States); 8-12 Aug 1994. Order Number DE94018044. Source: OSTI; NTIS; GPO Dep.

Edge magnetoplasmons of two-dimensional electron gas (2DEG) systems with density profiles that fall from their bulk value to zero in a non-abrupt manner are investigated. Higher multipole modes, which can be thought of as bulk plasmons of the low density edge region, exist as localized edge modes only for finite values of wavevector along the edge. In addition, a sequence of very low frequency edge magnetoplasmons displaying linear dispersion are found for only one direction of propagation along the edge for a given applied magnetic field. Some insight is gained from the analysis of a simple double step density profile.

6858 (ANL/MSD/CP–83118) **BCS-like gap structure of $HgBa_2CuO_{4+\delta}$ tunnel junctions.** Chen, J. (Argonne National Lab., IL (United States)); Zasadzinski, J.F.; Gray, K.E.; Wagner, J.L.; Hinks, D.G.; Kouznetsov, K.; Coffey, L. Argonne National Lab., IL (United States). [1994]. 5p. Sponsored by USDOE, Washington,

DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. NSF Contract DMR-91-20000. (CONF-941013–16: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95004125. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report point-contact tunneling into polycrystalline $HgBa_2CuO_{4+\delta}$ superconductors with a T_c onset of 97 K using a superconducting Nb counterelectrode. These SIS tunnel junctions are of unusually high quality for cuprate superconductors, exhibiting low and flat sub-gap conductances and sharp conductance peaks as expected from a BCS density of states. These features are obtained reproducibly and are consistent with earlier published SIN results using an Au counterelectrode. Use of experimental data to simulate the performance of a quasiparticle mixer indicates that $HgBa_2CuO_{4+\delta}$ may be suitable for use in low noise heterodyne receivers operating at a few THz.

6859 (ANL/MSD/CP–84784) **Melting of the moving vortex lattice in the presence of disorder.** Koshelev, A.E.; Vinokur, V.M. Argonne National Lab., IL (United States). Materials Science Div. Jul 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940701–22: Meeting on materials and mechanisms of superconductivity: high temperature superconductors, Grenoble (France), 4-9 Jul 1994). Order Number DE95004126. Source: OSTI; NTIS; INIS; GPO Dep.

The authors investigate the melting of the two-dimensional vortex lattice moving in an inhomogeneous environment under the applied current j. They predict the existence of a dynamic phase transition at some current $j = j_t$ (crystallization current) from the motion of the amorphous configuration at $j < j_t$ to the motion of the crystal at $j > j_t$. j_t exceeds essentially the critical current j_c for strongly disordered systems and approaches j_c with the decrease of the degree of disorder. They find that j_t diverges as temperature approaches the melting temperature of the undisturbed lattice.

6860 (INIS-RU–379, pp. 49-51) **Radiation-acoustic study of a superconducting state in $YBa_2Cu_3O_7$.** Burlikov, V.L.; Vorob'ev, S.A. AN SSSR, Moscow (Russian Federation); Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1993. 169p. (In Russian). (CONF-9205318–: 22. Conference on physics of charged particle interaction with crystals, Moscow (Russian Federation), 25-27 May 1992). In *Proceedings of 22. international meeting on the physics of charged particle interaction with crystals.* Order Number DE95611565. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation-acoustic study of a superconducting state in $YBa_2Cu_3O_7$ is carried out. Acoustic oscillations were generated by pulsed 5.7 MeV electron beams. A usual temperature-dependent variation in the acoustic signal amplitude (ASA) is noticed in the experiment. The ASA values are ranging due to variation of thermal parameters of contact lubricant. 4 refs., 2 figs.

6861 (LA-UR–94-3725) **HTS current lead using a composite heat pipe.** Daugherty, M.A.; Prenger, F.C.; Hill, D.D.; Daney, D.E.; Woloshun, K.A. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941013–14: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95003718. Source: OSTI; NTIS; GPO Dep.

This paper discusses the design and fabrication of HTS current leads being built by Los Alamos to supply power to a demonstration HTS coil which will operate in a vacuum cooled by a cryocooler. Because vapor cooling is not an option for this application the leads must be entirely conductively cooled. In the design of HTS current leads for this type of application, it is desirable to intercept part of the heat load at an intermediate temperature. This thermal intercept or connection must be electrically insulating but thermally conductive, two mutually exclusive properties of most candidate solid materials. To achieve this end we incorporate a composite nitrogen heat pipe, constructed of conducting and non-conducting materials, to provide efficient thermal communication and simultaneously, electrical isolation between the lead and the intermediate temperature heat sink. Another important feature of the current lead design is the use of high Jc thick film superconductors deposited on a non-conducting substrate to reduce the conductive heat leak through the lower portion of the lead. Two flexible electrical conductors are incorporated to accommodate handling, assembly and the dissimilar expansion coefficients of the various materials.

6862 (CIEMAT–738) **Setting-up of the Laser Induced Fluorescence diagnostic. Measurements of Cr density in a neon glow discharge.** Tafalla, D.; Cal, E. de la; Tabares, F.L. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 20p. (In Spanish). Order Number DE95721647. Source: OSTI; NTIS; INIS.

A plasma diagnostic based on the Laser Induced Fluorescence (LIF) technique has been set up in the Fusion Division at the CIEMAT. In a preliminary experiment, The density of sputtered chromium atoms produced in a neon glow discharge was measured. Firstly, the laser beam was characterized by calibration of its wavelength bandwidth and energy profile and Rayleigh scattering in N_2 was used for the optical system calibration. An absolute density of Cr atoms of n= 5x10^9 cm^-3 was obtained in discharges at 100 mA and pressure of 15 mTorr and a linear dependence of the LIF signal US. current was found. These values are in agreement with those expected from the tabulated sputtering yields and the thermalization and diffusion of the sputtered atoms into the Ne plasma.

6863 (CIEMAT–739) **Plasma diagnostics for tokamaks and stellarators.** Stott, P.E.; Sanchez, J. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 321p. Order Number DE95722411. Source: OSTI; NTIS; INIS.

A collection of papers on plasma diagnostics is presented. The papers show the state of the art developments in a series of techniques: magnetic diagnostics, Edge diagnostics, Langmuir probes, Spectroscopy, Microwave and FIR diagnostics as well as Thomson Sattering. Special interest was focused on those diagnostics oriented to fluctuations measurements in the plasma.

6864 (DOE/ER/53173–T3) **[Fluctuations and transport in fusion plasma].** California Inst. of Tech., Pasadena, CA (United States). [1989]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-84ER53173. Order Number DE95004177. Source: OSTI; NTIS; GPO Dep.

This research is aimed at furthering the understanding of turbulent fluctuations in fusion plasmas and the anomalous transport of particles, heat, and momentum which results therefrom. This understanding is critical to the design of future plasma confinement devices. This study involves a combination of experimental measurements, from the Caltech and other tokamaks, analysis and interpretation of measurements, computer calculations of basic processes, and comparisons of the latter with experiment.

6865 (DOE/ER/53173–T4) **[Fluctuations and transport in fusion plasma]: Progress report, October 1, 1989–September 30, 1990.** California Inst. of Tech., Pasadena, CA (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-84ER53173. Order Number DE95004178. Source: OSTI; NTIS; INIS; GPO Dep.

In the study of plasma collection by obstacles in a tokamak edge plasma, the effect of anomalous transport have been examined using an extension of the 2D fluid code developed here previously (Appendices A and B). The origin of the anomalous transport is assumed to be a randomly fluctuating electric field such as would be caused by drift waves. As before, the magnetic field is assumed to be uniform and perpendicular to the obstacle, which is taken to be an infinite strip. In the absence of ambient plasma flow, the numerical results indicate that ion viscous heating is important near the tip of the obstacle, where there is a large velocity gradient in the

flow. For typical plasma parameters, the maximum ion temperature near the tip is up to 85% higher than the ambient ion temperature. When there is a subsonic plasma flow past the obstacle, the numerical results indicate that, near the tip of the obstacle, the ions on the downstream side are hotter than those on the upstream side. Furthermore, the ion density is higher on the upstream side. A detailed report of this work has been prepared and will be submitted as part of the Annual Progress Report. Recently, the 2D parallel electrostatic plasma particle-in-cell (PIC) code described in reference (9) (Appendix B) has been upgraded to a 2D fully electromagnetic PIC code. This code has been successfully tested on the JPL/Caltech Mark III Hypercube concurrent computers and can be used to simulate interactions of electromagnetic waves with a magnetized plasma. It is currently applied to investigate the decay of large amplitude Alfven waves, such as those observed in the solar wind. Large amplitude Alfven waves, propagating parallel to the magnetic field, are predicted to decay into obliquely propagating daughter waves and standing magnetosonic waves. Results from the simulations will be compared with theoretical predictions.

6866 (DOE/ER/53198–251) **Generation of fast electrons in reversed field pinches by the equilibrium grad |B| force.** Fiksel, G. Wisconsin Univ., Madison, WI (United States). Plasma Physics Research. Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE95004467. Source: OSTI; NTIS; INIS; GPO Dep.

It is shown that a decreasing magnetic field profile in reversed-field pinch plasmas leads to formation of an anisotropic electron distribution function at the plasma edge. The mechanism is the conservation of the magnetic moment and the energy of electrons that collisionlessly travel outward in a stochastic magnetic field. As a result, the electrons have high parallel energies and low perpendicular energies at the edge. The details of the distribution function correspond well to experimental results.

6867 (DOE/ER/53266–48) **Transport suppression by diamagnetic phase shift as a possible mechanism to the L to H transition.** Isichenko, M.B. (Univ. of Texas, Austin, TX (United States). Fusion Research Center); Diamond, P.H. Texas Univ., Austin, TX (United States). Fusion Research Center; Texas Univ., Austin, TX (United States). 28 Sep 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER53266 ; FG03-94ER54241. (FRCR–451). Order Number DE95003345. Source: OSTI; NTIS; INIS; GPO Dep.

In the presence of a pressure gradient, the phase velocity of drift-wave or ITG-mode turbulence is different from the poloidal E×B rotation velocity of guiding centers. This results in an E×B turbulent particle diffusion being suppressed by the phase shift due to the diamagnetic rotation velocity v_θ = (c/enB)dP/dr. This shift cannot be eliminated by a frame change and affects the plasma transport. For v_θ well above the turbulent velocity $v = -c\nabla\phi\times B/B^2$, the radial diffusivity is suppressed as $D \propto v_\theta^{-3}$. This results in a non-monotonous particle flux $\Gamma(\nabla n) \simeq -D_0\nabla n[1+\alpha(\nabla n)^2]^{3/2}$ such as the transport can develop a bifurcation at a realistic density gradient.

6868 (DOE/ET/53088–671) **Energetic particle drive for toroidicity-induced Alfven eigenmodes and kinetic toroidicity-induced Alfven eigenmodes in a low-shear Tokamak. Revised.** Breizman, B.N. (Univ. of Texas, Austin, TX (United States). Inst. for Fusion Studies); Sharapov, S.E. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies. Oct 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. (IFSR–671). Order Number DE95003222. Source: OSTI; NTIS; INIS; GPO Dep.

The structure of toroidicity-induced Alfven eigenmodes (TAE) and kinetic TAE (KTAE) with large mode numbers is analyzed and the linear power transfer from energetic particles to these modes is calculated in the low shear limit when each mode is localized near a single gap within an interval whose total width Δ^{out} is much smaller than the radius r_m of the mode location. Near its peak where most of the mode energy is concentrated, the mode has an inner scalelength Δ^{in}, which is much smaller than Δ^{out}. The scale Δ^{in} is determined by toroidicity and kinetic effects, which eliminate the singularity of the potential at the resonant surface. This work examines the case when the drift orbit width of energetic particles Δ_b is much larger than the inner scalelength Δ^{in}, but arbitrary compared to the total width of the mode. It is shown that the particle-to-wave linear power transfer is comparable for the TAE and KTAE modes in this case. The ratio of the energetic particle contributions to the growth rates of the TAE and KTAE modes is then roughly equal to the inverse ratio of the mode energies. It is found that, in the low shear limit the growth rate of the KTAE modes can be larger than that for the TAE modes.

6869 (GA-A–21799) **q Profile evolution and enhanced core confinement of high β_p plasmas in DIII-D.** Stallard, B.W. (Lawrence Livermore National Lab., CA (United States)); Casper, T.A.; Fenstermacher, M.E. General Atomics, San Diego, CA (United States); Lawrence Livermore National Lab., CA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; W-7405-ENG-48. (IAEA-CN–60/A3/5-P-11; CONF-940994–3: 15. international conference on plasma physics and controlled nuclear fusion research, Madrid (Spain), 26 Sep - 1 oct 1994). Order Number DE95003878. Source: OSTI; NTIS; INIS; GPO Dep.

In DIII-D the authors have investigated the long pulse evolution of high poloidal beta ($_{betap}$), double-null diverted H-mode discharges, which exhibit high bootstrap current fractions attractive for a reactor. At low currents I_p, the current profile evolved over several seconds and the on-axis safety factor (q_0) increased. When q_0 increased above ~2, the MHD character changed from an m/n = 2/1 to an m/n = 3/1 internal kink mode, where m(n) are poloidal (toroidal) mode numbers, which then disappeared with further increases in q_0. Coincident with a strong reduction of fluctuations, the authors observed enhanced core confinement, leading to strong density peaking, a further rise in β_p, and a bootstrap current increasing to $I_{boot}/I_p \approx 0.8$, peaked within the core. Ideal MHD calculations showed access to second stability during the density rise. During the enhanced performance phase core particle lifetime (τ_p) and global energy lifetime (τ_E) increased by factors of 2 and 1.2 respectively. Transport analysis showed that core particle and thermal diffusivities D_e and χ_{eff} approached neoclassical values. During the low current experiments, large losses of fast ions (typically ~50% at 0.4 MA) were observed; at higher currents these losses are much smaller. The authors have also investigated discharges with current rampdown to high β_p. For a 5 to 6 τ_E duration following rampdown, enhanced values of β_p, normalized toroidal beta (β_N), and τ_E were obtained at high internal inductance (l_i). During both the ramp and the high confinement phases, fast ion losses were low (~10%). The loss then increased, correlated with an increase in the anisotropy ratio of perpendicular and parallel plasma pressure that suggests a fast ion loss mechanism coupled to the fast ion parallel energy.

6870 (GA-A–21811) **Experimental aspects of effects of high-energy particles on Alfven modes.** Heidbrink, W.W. General Atomics, San Diego, CA (United States). Oct 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-9408176–3: ISPP workshop on the theory of fusion plasmas, Varenna (Italy), 22-26 Aug 1994). Order Number DE95003383. Source: OSTI; NTIS; INIS; GPO Dep.

Global Alfven modes are observed in a number of tokamaks, including DIII-D and TFTR. Instabilities occur during neutral-beam injection and during fast-wave ICRF heating, and may recently have been observed during alpha-particle heating. Identification of toroidicity-induced Alfven eigenmodes (TAE) is based primarily on the scaling of the real frequency of the mode. Other modes, including the beta-induced Alfven eigenmode (BAE), are also observed. The stability threshold of TAE modes agree (to within a factor of two) with theoretical predictions. Toroidal mode numbers of n = 2-6 are usually most unstable, as theoretically expected. Measurements of the poloidal and radial mode structure are consistent with theoretical predictions, but the uncertainties are large. Both TAE and BAE modes can cause large, concentrated losses of fast ions. Phenomenologically, beam-driven Alfven modes usually "saturate" through bursts that expel beam ions, while modes observed during ICPF heating approach a steady saturation amplitude.

6871 (GA-A–21839) **Engineering and design of a CO_2 phase contrast interferometer system for DIII-D.** Phelps, R.D.

(General Atomics, San Diego, CA (United States)); Coda, S. General Atomics, San Diego, CA (United States). Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. Order Number DE95004249. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the development of a CO_2 laser interferometer system, the engineering, design and installation of the hardware, and the selection of materials specific to the requirements of a CO_2 laser diagnostic. A brief description of system operation is included. A phase contrast interferometer diagnostic has been designed and installed on the DIII-D tokamak to enhance studies of the physical characteristics of plasma turbulence, and specifically to analyze plasma density fluctuations in the boundary region of the plasma. A 20 watt CO_2 laser beam, operating at the 10.6 micron wavelength, is expanded to a diameter of 76 mm and directed through a series of mirrors which provide for entry of the beam into the vessel at a point 70 cm above the midplane at the 285 degree toroidal location. After being reflected from a mirror inside the vessel, the beam is directed downward so that it passes through the edge of the plasma immediately in front of a four-strap fast wave current drive rf antenna. The laser beam is then reflected by a second internal mirror and exits the vessel 70 cm below the midplane (also at 285 degrees) returning to an optical table through a final series of external steering mirrors.

6872 (GA-A–21847) **Transport simulation of negative magnetic shear discharges.** St. John, H.; Taylor, T.S.; Lin-Liu, Y.R.; Turnbull, A.D. General Atomics, San Diego, CA (United States). Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (IAEA-CN–60/D-D-II-8; CONF-940933–20: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003941. Source: OSTI; NTIS; INIS; GPO Dep.

In the present work the authors present simulations which show that the hollow current profile can be maintained in quasi-steady state through a self-consistently determined combination of bootstrap current and neutral beam and rf current drive. Controllability of the q profile is demonstrated by eliminating low m/n mode number instabilities from these discharges by maintaining $q > 1.5$ at all times, starting from appropriate initial conditions. At moderately high β_p, the bootstrap current can be a substantial fraction of the total current and the ability to maintain the proper total current density profile depends on the bootstrap current profile and the availability of suitable localized heating and current drive. In these simulations, they use electron cyclotron heating, ion cyclotron heating, and electron cyclotron and fast wave current drive. The ability to maintain the profiles is demonstrated using several energy transport models. Self-consistent transport simulations are used to model the SSC discharges using the ONETWO transport code coupled to rf heating and current drive packages FASTWAVE and TORAY. To accurately model inductive and driven current profile evolution, the additional source terms that arise in Faraday's law due to internal flux surface motion are included by coupling the transport calculations to a fixed boundary equilibrium code. To test the sensitivity of the results to the transport model used, they model DIII-D discharges using thermal conductivities consistent with improved confinement DIII-D discharges, and with the Rebut-Lallia-Watkins model of energy transport.

6873 (JAERI-Research–94-001) **Transport studies of tokamak plasmas in JT-60 device.** Shirai, Hiroshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 257p. Order Number DE95737227. Source: OSTI; NTIS; INIS.

In order to study the magnetic flux exchange at the sawtooth crash, the nonlinear evolution of the tearing mode with poloidal mode number m=1 and toroidal mode number n=1 in the presence of two or three resonant surfaces satisfying q=m/n=1 is examined. It is clarified that whether the local magnetic flux exchange or the internal disruption occurs depends on the initial profile of helical flux function ϕ_0. Light impurities such as carbon and oxygen and metal impurities such as titanium and molybdenum cause dominant radiation loss in the high density regime and give rise to major disruption. Increasing density by gas puffing while keeping the impurity content constant, the density limit of ohmically heated plasmas is studied. The numerically obtained operational diagram or Hugill diagram, qualitatively agrees well with that obtained in the experiment. Characteristics of global parameter dependence of JT-60 plasmas in both ohmic heating phase and neutral beam heating phase have been studied by using the models of electron and ion thermal diffusivities, χ_e and χ_i. The predicted T_e profile and the energy confinement time, τ_E, show good agreement with experimental data in the medium line for both ohmic heating and neutral beam heating phase. The power degradation of energy confinement time ($\tau_E{}^{th} \propto P_{abs}{}^{-1/2}$) is also reproduced. Ion temperature profiles of neutral beam heated phase of JT-60 have been simulated by using a χ_i model based on η_i mode turbulence and the drift wave turbulence. In case of TFTR L-mode plasmas, the simulated T_i profiles become flatter than experimental data. In the high T_i plasmas of JT-60 and supershot plasmas of TFTR, the predicted T_i profiles become broader compared with the experimental results. (J.P.N.).

6874 (JAERI-Research–94-011) **Onset of ELMs in JT-60U.** Kamada, Yutaka (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Sato, Masayasu; Kikuchi, Mitsuru; Mori, Masahiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 22p. Order Number DE95737209. Source: OSTI; NTIS; INIS.

The ELMs limiting the energy confinement in JT-60U appear when the heating power is high enough compared to the threshold power for the L-H transition. The ELM-free phase is observed when n-bar_e is lower than the threshold density $\text{n-bar}_e{}^{th}$. The threshold density $\text{n-bar}_e{}^{th}$ increases with $(B_t{}^2/(Rq_{eff}{}^2))_l$ which is a measure parameter for the ballooning stability, where q_{eff} is the effective safety factor at the edge. The edge pressure gradient estimated by $\text{n-bar}_e{}^{th}$ T_i (95%)/(T_i (95%)$^{0.5}$/B_p (a)) is proportional to $(B_t{}^2/(Rq_{eff}{}^2))_l$ which allows us to understand that the ELMs are related to the ballooning instability. A time dependent analysis of the evolution of pressure and current profiles including the boot-strap current shows that the steep edge pressure gradient is close to the marginal value for the high-n ideal ballooning instability at the onset of ELMs. (author).

6875 (JAERI-Research–94-013) **Stability analysis of external kink mode for ITER L-mode profile plasmas.** Tokuda, Shinji (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Ozeki, Takahisa. Japan Atomic Energy Research Inst., Tokyo (Japan). Sep 1994. 21p. Order Number DE95737207. Source: OSTI; NTIS; INIS.

A stability analysis is made for the n=1 external kink mode (n: toroidal mode number) to the predicted ITER L-mode profiles. The beta limit (g_T) for this kink mode is sufficiently higher than the design value of g_T=2.0-2.4 for the L-mode profiles in case of the assumed current profile even with a finite but small edge current. However, in case of q_0 less than unity (q_0: safety factor on the magnetic axis) the beta limit for the kink mode is significantly reduced: g_T is 1.0 for q_0=0.8 without a conducting wall. A conducting wall located near the mid-plane has a stronger stabilizing effect than a wall located near the null point. (author).

6876 (LA-UR–94-3664) **Tritium transport, influx, and helium ash measurements on TFTR during DT operation.** Efthimion, P.C. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Johnson, L.C.; Skinner, C.H. Los Alamos National Lab., NM (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-940933–18: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003708. Source: OSTI; NTIS; INIS; GPO Dep.

The evolution of the tritium density profile is inferred from 14.1 MeV t(d,n)α and 2.5 MeV d(d,n)^{3}He neutron emissivity profiles measured in a deuterium neutral beam heated plasma into which a small amount of tritium gas has been puffed. For the first time, hydrogenic ion transport coefficients in the form of a diffusivity and convective velocity are determined. The particle diffusivities of tritium and ^{4}He, and the deuterium thermal diffusivity are of similar

magnitudes, and thus are consistent with theoretically calculated ExB drift transport. The first measurements of helium ash have been made using charge exchange recombination spectroscopy (CHERS). The measured radial ash profile shape is consistent with that predicted from simulations that include calculations of the central alpha ash source and thermal ash transport. This suggests that ash transport in the plasma core will not be a fundamental limiting factor in determining helium exhaust rates in a reactor. The authors also report the first spectroscopic measurements of tritium Balmer-alpha emission which provided a measure of tritium influx from the limiter. Tritium influx persists in discharges subsequent to tritium neutral beam injection, decaying with an initial decay of 7.5 discharges, and followed by a long term decay on the order of 400 discharges. Tritium transport, influx, and helium ash transport are important issues concerning profile control, retention, and ash removal for future reactors, like ITER.

6877 (LRP–499/94) **A direct Poisson solver for Particle-In-Cell (PIC) simulation.** Tran, T.M. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Appert, K.; Sauter, O. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. 12p. A direct Poisson solver, based on the isoparametric finite element discretization and a domain decomposition technique, is described. A simple parallelization scheme is proposed and evaluated on a 128 processor Cray T3D. (author) 4 figs., 2 tabs., 8 refs.

6878 (LRP–500/94) **Global marginal stability of TAEs in the presence of fast ions.** Villard, L. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Brunner, S.; Vaclavik, J. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. 48p. Order Number DE95611650. Source: OSTI; NTIS; INIS.

The global stability of toroidicity-induced Alfven eigenmodes (TAEs) in the presence of fast ions in realistic tokamak fusion-grade plasmas is analyzed with a global, perturbative approach. Volume averaged fast particle betas for marginal stability are obtained and analyzed for a wide range of plasma parameters such as the fast ion radial density profile width, the ratio of birth velocity to the Alfven velocity on axis and the bulk plasma beta. The different stability behaviour of two types of TAEs ('internal' or 'external') is evidenced. (author) 19 figs., 22 refs.

6879 (LRP–501/94) **ELM control during double-null Ohmic H-modes in TCV.** Dutch, M.J. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Hofmann, F.; Duval, B.P.; Hirt, A.; Joye, B.; Lister, J.B.; Martin, Y.; Nieswald, C.; Pochelon, A.; Weisen, H. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. 11p. Order Number DE95611651. Source: OSTI; NTIS; INIS.

Precise control of the shape and position of Double-Null divertor configurations in the TCV tokamak has been used to reliably trigger the transition from ELM-free to ELMy Ohmic H-Mode and back. Pre-programmed modulation of the magnetic axis height, with fixed shaping field, caused the plasma to evolve, during a single discharge, between Double-Null-Upper, Double-Null and Double-Null-Lower configurations, with both X-points remaining close to the last closed flux surface. The transition from ELM-free to ELMy and back again was observed to be synchronous with the configuration modifications. Using this method, several ELM-free and ELMy phases enabled reproducible disruption-free H-mode discharges in TCV lasting up to 1.5 seconds. The plasma density during a long-duration H-mode was directly controlled by feeding back onto the vertical height of the magnetic axis. (author) 4 figs., 18 refs.

6880 (LRP–502/94) **Stabilization of ideal modes by resistive walls in tokamaks with plasma rotation and its effect on the beta limit.** Ward, D.J. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Bondeson, A. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. [41p.] Order Number DE95611652. Source: OSTI; NTIS; INIS.

It is shown that pressure-driven, ideal external modes in tokamaks can be fully stabilized by resistive walls when the plasma rotates at some fraction of the sound speed. For wall stabilized plasmas, there are two types of potentially unstable external modes: those which are nearly locked to the wall and those which rotate with the plasma. For the modes rotating with the plasma, the stabilizing effect of the wall increases when the wall is brought closer to the plasma, while, for the wall-locked modes, the stabilization improves with increasing wall distance. When the plasma rotates at some fraction of the sound speed, there is a window of stability to both the wall-locked and the rotating mode. This window closes when beta exceeds a new limit which can be significantly higher than the wall-at-infinity limit. The stabilization depends principally on the toroidal coupling to sound waves and is affected by ion Landau damping. Two dimensional stability calculations are presented to evaluate the gains in beta limit resulting from this wall stabilization for different equilibria and rotation speeds. In particular, results are shown for advanced tokamak configurations with bootstrap fractions of $\simeq$ 100%. (author) 14 figs., 25 refs.

In this paper we adopt a global approach. The TAEs are computed globally in true toroidal geometry consistent with an ideal MHD equilibrium. Kinetic effects (damping and driving mechanisms) and fast particles are treated perturbatively. More precisely, we first obtain the global eigenmodes an then use these given eigenmode fields to evaluate the global overall wave-particle power transfer assuming given fast particle density profiles. The marginal stability point is obtained by scaling the number of fast particles so that the overall power transfer is zero. The wave-particle power transfers are evaluated using the drift-kinetic equations. The paper is structured as follows: In section two, the plasma model in toroidal geometry is briefly presented. The expressions for the DKE powers are derived for the various species in the companion paper in these proceedings. In section 3 we show the results of our model applied to a wide variety of plasma parameters. In particular, the critical volume-averaged fast particle beta corresponding to marginal stability, $<\beta_f>_\alpha$, is calculated for a wide range of bulk plasma parameters and fast particle profile widths. We discuss the results in section 4 and draw some conclusions in section 5.(author) 13 figs., 21 refs.

Using the bicubic finite element codes CHEASE and PENN, Maxwell's equations are solved for global wavefields in a realistic tokamak equilibrium. Two different models have been implemented to calculate the linear response of the plasma: a cold resistive model which gives results in good agreement with the cold toroidal code LION in the case of TAE mode computations. The second is a hot kinetic model, which is validated with the hot cylindrical code ISMENE, reproducing the mode conversion to a kinetic Alfven wave in the large aspect ratio limit. Using the new tool for a preliminary study, self-consistent (non-perturbative) calculations of TAE mode wavefields show how finite Larmor radius effects can couple a gap mode to the kinetic Alfven wave, resulting in a radiatively damped KTAE mode. (author) 5 figs., 9 refs.

We have developed a 3-D code, $CQL_{//}$, which solves the drift-kinetic Fokker-Planck equation along the magnetic field line on a given flux surface. It is 2-D in velocity space and 1-D spatially along B. Therefore no bounce-averaging is performed and the model is valid for arbitrary collisionality and axisymmetric tokamak equilibria. The adjoint function formalism has been adapted to calculate the neoclassical bootstrap current, assuming small banana width compared with the minor radius. We compare the results of our code with published analytical formulae and with the results of the modified bounce-averaged code CQL3D. (author) 4 figs., 12 refs.

6887 (LRP–505/94) **Electron cyclotron resonance heating.** Pochelon, A. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)). Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. 20p. Order Number DE95611665. Source: OSTI; NTIS; INIS.

With the availability of high frequency ($f \geq 50$ GHz) high power microwave sources, Electron Cyclotron Resonance Heating (ECRH) is widely used in present-day tokamaks and stellarators and is planned for applications in ITER (International Thermonuclear Experimental Reactor). ECRH can be used over a broad spectrum of applications ranging from heating, with the aim of increasing plasma temperature and pressure, to plasma profile tailoring, in particular current profile tailoring, with the aim of enhancing or optimising stability and confinement properties. The presentation is structured as follows: the first points to be discussed when considering ECRH are accessibility and absorption, although it will be seen that it is not easy to separate one from the other due to the links between absorption and propagation. Some examples of the use of ECRH as a tool for different physics applications in tokamaks will be addressed. The applications envisioned for the Next Step (ITER) and for the Reactor will be the subject of the last chapter. (author) 16 figs., 3 tabs., 28 refs.

6888 (LRP–506/94) **Spatio-temporal powder formation and trapping in RF silane plasmas using 2-D polarization-sensitive laser scattering.** Dorier, J.L. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Hollenstein, C.; Howling, A.A. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Sep 1994. 20p. Order Number DE95611671. Source: OSTI; NTIS; INIS.

Contributed paper to the 41. National Symposium of the American Vacuum Society, Denver, 24-28 October 1994.

Powder formation studies in deposition plasmas are motivated by the need to reduce contamination in the plasma and films. Models for the force acting upon particles in rf discharges suffer from a lack of quantitative experimental data for comparison in the case of silane-containing plasmas. In this work, a cross-section of the parallel-plate capacitor discharge is illuminated with a polarized beam-expanded laser and global spatio-temporal scattered light and extinction are recorded by CCD cameras. Spatially-regular periodic bright/dark zones due to constructive/destructive Mie interference are visible over large regions of the powder layers, which shows the uniform nature of particle growth in silane plasmas. For particles trapped in an argon plasma, as for steady-state conditions in silane, spatial size segregation is demonstrated by fringes which reverse according to the polarisation of scattered light. The method allow a self-consistent estimation of particle size and number density throughout the discharge volume from which strong particle Coulomb coupling ($\Gamma > 40$) is suggested to influence powder dynamics. Correction must be made to the plasma emission profile for the extinction by powder. In conclusion, this global diagnostics improves understanding of particle growth and dynamics in silane rf discharges and provides experimental input for testing the validity of models. 6889 (LRP–507/94) **Reconstruction of the time-averaged sheath potential profile in an argon RF plasma using the ion energy distribution.** Fivaz, M. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Brunner, S.; Schwarzenbach, W.; Howling, A.A.; Hollenstein, C. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Oct 1994. 18p. Order Number DE95611639. Source: OSTI; NTIS; INIS.

Charge-exchange collisions and radio-frequency excitation combine to give peaks in the ion energy distribution measured at the ground electrode of an argon plasma in a capacitive reactor. These peaks are used as a diagnostic to reconstruct the profile of the time-averaged potential in the sheath. Particle-In-Cell simulations show that the method is accurate. The method is applied to investigate the sheath thickness as a function of excitation frequency at constant plasma power. The time-averaged potential is found to be parabolic in both experimental measurements and numerical simulation. (author) 6 figs., 1 tab., 15 refs.

Preprint of an invited talk given at the International Workshop on Alfven Waves in Honor of Prof. Hannes Alfven, Rio de Janeiro, Brazil, 8-10 November, 1994.

Alfven waves in fusion plasmas play an important role in a number of situations. First, in Alfven Wave Heating (AWH) schemes. Second, both theory and experiment have demonstrated the existence of Global Alfven Eigenmodes (GAEs). GAEs have been observed in different tokamaks (PRETEXT, TCA, TEXTOR, etc.) and, more recently, in a stellarator (Wendelstein 7-AS) where they were shown to become unstable under intense Neutral Beam injection. Third, the existence and possible destabilization by fast ions of Toroidicity induced Alfven Eigenmodes (TAEs) has been evidenced both theoretically and experimentally. This destabilization could hamper the operation of a magnetically confined fusion reactor by setting a limit on the number of fusion alpha particles in the plasma. It is therefore crucial to understand the mechanisms leading to the occurrence of the instability and also those that can stabilize the TAEs by increasing the strength of the damping. The aim is to be able to devise possible ways to avoid the instability of Alfven eigenmodes in a region of parameter space that is compatible with the functioning of a fusion reactor. A global perturbative approach is presented to tackle the problem of the linear stability of TAEs. Our model computes the overall wave particle power transfers to the different species and thus could also be applied to the study of alpha power extraction in the presence of Alfven waves. We indicate also how to go beyond the perturbative approach. (author) 15 figs., 38 refs.

6891 (UCRL-ID–117110) **Lower hybrid current drive for edge current density modification in DIII-D: Final status report.** Fenstermacher, M.E. (Lawrence Livermore National Lab., CA (United States)); Porkolab, M. Lawrence Livermore National Lab., CA (United States). 4 Aug 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95004195. Source: OSTI; NTIS; INIS; GPO Dep.

Application of Lower Hybrid (LH) Current Drive (CD) in the DIII-D tokamak has been studied at LLNL, off and on, for several years. The latest effort began in February 1992 in response to a letter from ASDEX indicating that the 2.45 GHz, 3 MW system there was available to be used on another device. An initial assessment of the possible uses for such a system on DIII-D was made and documented in September 1992. Multiple meetings with GA personnel and members of the LH community nationwide have occurred since that time. The work continued through the submission of the 1995 Field Work Proposals in March 1993 and was then put on hold due to budget limitations. The purpose of this document is to record the status of the work in such a way that it could fairly easily be restarted at a future date. This document will take the form of a collection of Appendices giving both background and the latest results from the FY 1993 work, connected by brief descriptive text. Section 2 will describe the final workshop on LHCD in DIII-D held at GA in February 1993. This was an open meeting with attendees from GA, LLNL, MIT and PPPL. Summary documents from the meeting and subsequent papers describing the results will be included in Appendices. Section 3 will describe the status of work on the use of low frequency (2.45 GHZ) LH power and Parametric Decay Instabilities (PDI) for the special case of high dielectric in the edge regions of the DIII-D plasma. This was one of the critical issues identified at the workshop. Other potential issues for LHCD in the DIII-D scenarios are: (1) damping of the waves on fast ions from neutral beam injection, (2) runaway electrons in the low density edge plasma, (3) the validity of the WKB approximation used in the ray-tracing models in the steep edge density gradients.

6892 (UCRL-JC–117113) **Gyrokinetic and global fluid simulations of tokamak microturbulence and transport.** Dimits, A.M.; Byers, J.A.; Williams, T.J.; Cohen, B.I.; Xu, W.Q.; Cohen, R.H.; Crotinger, J.A.; Shestakov, A.I. Lawrence Livermore National Lab., CA (United States). 30 Aug 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940933–17: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003628. Source: OSTI; NTIS; INIS; GPO Dep.

Results are presented from the first systematic nonlinear kinetic simulation study of the swings and parameter dependences of toroidal ion-temperature-gradient (ITG) turbulence and transport, and from the first such study that includes sheared toroidal flows. Key results include the observation of clear gyroBohm scaling of the turbulent transport and of a surprisingly weak dependence of the transport on toroidal flow shear. Based on the simulation results, a parameterization of the transport is given that includes the dependence on all of the relevant physical parameters. The transition from local to nonlocal transport as a function of the profile scale length has been investigated using two-dimensional global fluid simulations of dissipative drift-wave turbulence. Local gyroBohm scaling is observed, except at very short profile scale lengths.

Lithium ceramics are one class of materials being considered as tritium breeders for fusion technology,and hydrogen is known to enhance the release of tritium from lithium ceramic materials. Dissociative hydrogen chemisorption on the Li_2O surfaces of the (100), (110), and (111) planes has been investigated with ab initio Hartree-Fock calculations. Calculations for unrelaxed crystal Li_2O structures indicated that except for the (100) surface, the (110) and (111) surfaces are stable. Results on the heterolytic sites of n-layer (110) (where $n \geq 2$) slabs and three-layer (111) slabs suggest that dissociative hydrogen chemisorption is endothermic. For a one-layer (110) slab at 100% surface coverage, the dissociative hydrogen chemisorption is exothermic, forming OH^- and $Li^+H^-Li^+$. The results also indicate that the low coordination environment in surface step structures, such as kinks and ledges, may plan an important role in the hydrogen chemisorption process. On the homolytic sites of the (110) and (111) surfaces, there is no hydrogen chemisorption.

6894 (CIEMAT–737) **Runaway transport studies in the TJ-I Tokamak.** Rodriguez, L.; Vega, J.; Rodriguez-Yunta, A; Castejon, F.; Pardo, C.; Navarro, A.P. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 27p. Order Number DE95721646. Source: OSTI; NTIS; INIS.

Runaway diffusion coefficient, Dr_r, for TJ-I tokamak has been deduced using two different methods: In the first one, D_r is obtained using the steady state approach for values of the runaway confinement time pi_r deduced from hard-X-ray Bremsstrahlung spectra; in the second method, D_r is deduced from sawteeth oscillations of HXR flux, and of SXR intensity, recorded simultaneously. Data have been taken in a scan with the toroidal magnetic field B_t.Values obtained for D_r=(5-10) m"2s"-1, decreasing with B_t are in both cases consistent. Assuming that magnetic turbulence is responsible for their transport, from D_r we can deduce b/B_t, the magnetic fluctuations level, and then infer the thermal conductivity coefficient $lambda_e$. The radial energy resolution of renaway electrons allows us to infer for b/B_T and $lambda_e$ values at the plasma edge and for an inner position about r=a/2. Results are in food agreement with those ones obtained in TJ-I using probes, spectroscopic methods, power balance analysis and a coupled analysis for temperature and density pulses.

6895 (GA-A–21741) **A vacuum window for a 1 MW CW 110 GHz gyrotron.** Moeller, C.P.; Doane, J.L.; DiMartino, M. General Atomics, San Diego, CA (United States). Jul 1994. 3p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC03-89ER52153. (CONF-9410163–1: 19. international conference on infrared and millimeter waves, Sendai (Japan), 17-21 Oct 1994). Order Number DE94016584. Source: OSTI; NTIS; INIS; GPO Dep.

Development of high power microwave sources for fusion applications is limited by the availability of suitable vacuum windows in the 100 to 200 GHz frequency range. A novel vacuum window is described which uses water cooled sapphire as the dielectric. Heat removal is achieved by using thin slats of sapphire interleaved and brazed to niobium hexagonal tubes in which the cooling water flows. Analysis indicates a window 100 cm^2 in area can readily pass 1 MW in the HE_{11} mode at 110 GHz for current experimental applications and 1 MW with a $HE_{11}{}^0$-$HE_{12}{}^0$ mixture at 170 GHz, the projected ITER frequency.

European symposium on fusion technology, Karlsruhe (Germany), 22-26 Aug 1994). Order Number DE95003741. Source: OSTI; NTIS; INIS; GPO Dep.

The DIII-D program has just completed a major addition to its ion cyclotron range of frequency (ICRF) systems. This upgrade project added two new fast wave current drive (FWCD) systems, with each system consisting of a 2 MW, 30 to 120 MHz transmitter, ceramic insulated transmission lines and tuner elements, and water-cooled four-strap antenna. With this addition of 4 MW of FWCD power to the original 2 MW, 30 to 60 MHz capability, experiments can be performed that will explore advanced tokamak plasma configurations by using the centrally localized current drive to effect current profile modifications.

Source: OSTI; NTIS; INIS; GPO Dep.

This paper reviews different helium-cooled first wall and blanket designs; and compares the selection of structural materials. The authors found that the solid breeder, SiC-composite material option generates the lowest amount of induced radioactivity and afterheat and has the highest temperature capability. When combined with the direct cycle gas turbine system, it has the potential to be the most economical fusion system and can compete with advanced fission reactors. When compared to martensitic steel and V-alloy, SiC-composite is the least developed of these three structural materials, a focused development effort will be needed. Fundamental research has begun in addressing the issues of optimized composite materials, irradiation effects, leak tightness and low activation braze materials. Development of helium-cooled high heat flux components and further development of the direct cycle gas turbine system will also be needed.

Source: OSTI; NTIS; INIS; GPO Dep.

Experiments to study the effect of plasma shape on performance show that the high performance levels characteristic of VH-mode plasmas are only obtained for high triangularity (δ). A characteristic difference in central heating efficiency is observed when high and low δ plasmas are compared. The authors find this difference to correlate well with the attainment of Mercier stability. The core plasma for the high δ cases achieves Mercier stability when q_0 rises above a critical value which depends on δ, providing direct access to the second-stable regime. Other attributes of the VH-mode commence after a delay. The rise in q_0 is attributable to the radial gradients in the neutral beam and bootstrap current sources. Simulation indicates that such plasmas would persist for many seconds if the rise in density could be controlled, maintaining a centrally peaked neutral beam deposition profile.

6899 (GA-A–21821) **Experimental achievement of toroidal beta beyond that predicted by "Troyon" scaling.** Taylor, T.S. (General Atomics, San Diego, CA (United States)). General Atomics, San Diego, CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Livermore National Lab., CA (United States). Sep 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; AC05-84OR21400 ; W-7405-ENG-48. (CONF-9408176–4: ISPP workshop on the theory of fusion plasmas, Varenna (Italy), 22-26 Aug 1994). Order Number DE95003880. Source: OSTI; NTIS; INIS; GPO Dep.

Tokamak experiments have made substantial progress toward improving the experimentally achievable beta limit beyond that predicted by Troyon scaling, β_{Troyon} (%) = 2.8 I/aB MA/m/T. These advances in achievable beta have come about from the modification of the plasma profiles, primarily the current density profile, and the utilization of stabilizing conducting structures. Both theory and experiment have shown that the beta limit increases with peaked current density profiles, high ℓ_i, and broad pressure profiles; scaling of the beta limit β_{max} (%) = 4 ℓ_i I/aB has been proposed. Experiments in DIII-D, TFTR, and JT-60U have all confirmed the increase of β with ℓ_i, using high powered heating and negative current ramps to increase ℓ_i. It is recognized that high ℓi_i is difficult to maintain at high β_N in steady-state conditions as a consequence of the profile of the bootstrap current: β is limited by low n external kinks. Profiles with a negative central shear and high edge current density have been proposed that are stable to the low n external kinks provided there is a stabilizing influence from a resistive wall. Experiments from PBX-M and DIII-D provide evidence that wall stabilization is effective and recent experiments at DIII-D have resulted in β_T = 12.5% and β_N = 4.3 at ℓ_i = 0.72 and q_{95} = 2.5; conditions that are expected to have a lower beta limit in the absence of wall stabilization.

6900 (GA-A–21840) **DIII-D program overview.** Stambaugh, R.D. Oct 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ; W-7405-ENG-48 ; AC05-84OR21400 ; FG03-86ER53225 ; AC04-94AL85000. (CONF-940933–19: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003879. Source: OSTI; NTIS; INIS; GPO Dep.

Recent DIII-D results support the feasibility of advanced tokamak operation ($H \equiv \tau_E/ITER89P$ up to 4 and $\beta_N \equiv \beta_T/(IaB_T)$ up to 6). Plasma rotation dynamics have been shown to be the key to the confinement improvement in H- and VH-mode, leading to the highest DIII-D fusion triple product of $n_D(0)\ \tau_E\ T_i(0) = 5 \times 10^{20}$ keV s/m^3. Plasma rotation, wall stabilization, and current profile control are important in exceeding nominal stability performance β_N = 3.5 and have assisted in achieving β_T = 12.5%. Excellent exhaust of deuterium and helium in ELMing H-mode was achieved in divertor operation using an in-vessel cryopump. Reduction of divertor heat loads was shown by radiative divertor operation. Achieving impurity

entrainment adequate for radiative divertor operation remains an objective of a future Radiative Divertor installation.

(IAEA-CN–60/A-4-I-2; CONF-940933–21: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003942. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the authors summarize recent progress on DIII-D in developing techniques for divertor power and particle control relevant to next generation tokamaks such as the proposed ITER and TPX devices. Density control and helium removal by divertor pumping have been demonstrated for the first time in high confinement ELMing H-mode discharges ($\tau \sim 2 \times \tau_{ITER-89P}$) following installation of a divertor cryopumping system. The peak divertor heat flux in similar H-mode discharges has been reduced through production of a radiating mantle with neon or argon puffing (reductions of 3–5). A number of diagnostics have been added to improve the understanding of the physical processes involved. They are now designing modified double-null divertor structures for DIII-D that will provide improved particle control for high-triangularity VH-mode plasmas while at the same time allowing for gas puffing to reduce the divertor heat flux.

6902 (JAERI-Tech–94-002) **Critical element development of standard pipe connector for remote handling.** Taguchi, Kou (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kakudate, Satoshi; Kanamori, Naokazu; Oka, Kiyoshi; Nakahira, Masataka; Obara, Kenjiro; Tada, Eisuke; Shibanuma, Kiyoshi; Seki, Masahiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 26p. Order Number DE95737226. Source: OSTI; NTIS; INIS.

In fusion experimental reactors such as ITER, the in-vessel components such as blanket and divertor are actively cooled and a large number of cooling pipes are located around the core of reactor, where personnel access is prohibited. Mechanical pipe connectors are highly required as standard components for easy and reliable connection/disconnection of cooling pipe by remote handling. For this purpose, a clamping chain type connector has been developed with special mechanisms such as plate springs and guide structures so as to enable concentric and axial movement of clamping chain for easy mounting and dismounting. The basic performance test of a prototypical connector for a 80-A pipe shows sufficient leak tightness and proof pressure capability as well as simple connection/disconnection operation. In addition to the clamp chain type connector, design efforts have been made to develop a quick coupling type connector and a preliminary model of air-actuated quick connector has been fabricated for further investigations. This paper gives the design concept of mechanical pipe connectors such as clamping chain type and quick coupler type, and the basic performance tests results of clamping chain type connector. (author).

6903 (JAERI-Tech–94-003) **Irradiation tests of critical components for remote handling in gamma radiation environment.** Obara, Henjiro (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kakudate, Satoshi; Oka, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 81p. Order Number DE95737223. Source: OSTI; NTIS; INIS.

Since the fusion power core of a D-T fusion reactor will be highly activated once it starts operation, personnel access will be prohibited so that assembly and maintenance of the components in the reactor core will have to be totally conducted by remote handling technology. Fusion experimental reactors such as ITER require unprecedented remote handling equipments which are tolerable under gamma radiation of more than 10^6 R/h. For this purpose, the Japan Atomic Energy Research Institute (JAERI) has been developing radiation hard components for remote handling purpose and a number of key components have been tested over 10^9 rad at a radiation dose rate of around 10^6 R/h, using Gamma Ray Radiation Test Facility in JAERI-Takasaki Establishment. This report summarizes the irradiation test results and the latest status of AC servo motor, potentiometer, optical elements, lubricant, sensors and cables, which are key elements of the remote handling system. (author).

6904 (JAERI-Tech–94-006) **Development of integrated insulation joint for cooling pipe in tokamak reactor.** Nishio, Satoshi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Abe, Tetsuya; Kawamura, Masashi; Yamazaki, Seiichiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 23p. Order Number DE95737220. Source: OSTI; NTIS; INIS.

In a tokamak fusion reactor, an electrically insulated part is needed for an in-vessel piping system in order to break an electric circuit loop. When a closed loop is formed in the piping system, large induced electromagnetic forces during a plasma disruption (rapid plasma current quench) could give damages on the piping system. Ceramic brazing joint is a conventional method for the electric circuit break, but an application to the fusion reactor is not feasible due to its brittleness. Here, a stainless steel/ceramics/stainless steel functionally gradient material (FGM) has been proposed and developed as an integrated insulation joint of the piping system. Both sides of the joint can be welded to the main pipes, and expected to be reliable even in the fusion reactor environment. When the FGM joint is manufactured by way of a sintering process, a residual thermal stress is the key issue. Through detailed computations of the residual thermal stress and several trial productions, tubular elements of FGM joints have been successfully manufactured. (author).

6905 (JAERI-Tech–94-007) **Design study of prototype accelerator and MeV test facility for demonstration of 1 MeV, 1 A negative ion beam production.** Inoue, Takashi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Hanada, Masaya; Miyamoto, Kenji; Ohara, Yoshihiro; Okumura, Yoshikazu; Watanabe, Kazuhiro; Maeno, Shuichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 95p. Order Number DE95737208. Source: OSTI; NTIS; INIS.

In fusion reactors such as ITER, a neutral beam injector of MeV class beam energy and several tens MW class power is required as one of candidates of heating and current drive systems. However, the beam energy of existing high power accelerators are one order of magnitude lower than the required value. In order to realize a neutral beam injector for the fusion reactor, 'Proof-of-Principle' of such high energy acceleration is a critical issue at a reactor relevant beam current and pulse length. An accelerator and an accelerator facility which are necessary to demonstrate the Proof-of-Principle acceleration of negative ion beams up to 1 MeV, have been designed in the present study. The accelerator is composed of a cesium-volume type ion source and a multi-stage electrostatic acceleration system [Prototype Accelerator]. A negative hydrogen ion beam with the current of about one ampere (1 A) can be accelerated up to 1 MeV at a low operating pressure. Two types of acceleration system, a multi-multi type and a multi-single type, have been studied. The test facility has sufficient capability for the test of the Prototype Accelerator [MeV Test Facility]. The dc high voltage generator for negative ion acceleration is a Cockcroft-Walton type and capable of delivering 1 A at 1 MV (=1 MW) for 60 s. High voltage components including Prototype Accelerator are installed in a SF_6 vessel pressurized at 6 kg/cm^2 to overcome high voltage gradients. The vessel and the beamline are installed in a X-ray shield. (author).

6906 (JAERI-Tech–94-009) **Development and trial manufacturing of 1/2-scale partial mock-up of blanket box structure for fusion experimental reactor.** Hashimoto, Toshiyuki (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Takatsu, Hideyuki; Sato, Satoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1994. 78p. (In Japanese). Order Number DE95737184. Source: OSTI; NTIS; INIS.

Conceptual design of breeding blanket has been discussed during the CDA (Conceptual Design Activities) of ITER (International Thermonuclear Experimental Reactor). Structural concept of breeding blanket is based on box structure integrated with first wall and shield, which consists of three coolant manifolds for first wall, breeding and shield regions. The first wall must have cooling channels to remove surface heat flux and nuclear heating. The box structure includes plates to form the manifolds and stiffening ribs to withstand enormous electromagnetic load, coolant pressure and blanket internal (purge gas) pressure. A 1/2-scale partial model of the blanket box structure for the outboard side module near midplane is manufactured to estimate the fabrication technology, i.e. diffusion bonding by HIP (Hot Isostatic Pressing) and EBW (Electron Beam Welding) procedure. Fabrication accuracy is a key issue to manufacture first wall panel because bending deformation during HIP may not be small for a large size structure. Data on bending deformation during HIP was obtained by preliminary manufacturing of HIP elements. For the shield structure, it is necessary to reduce the welding strain and residual stress of the weldment to establish the fabrication procedure. Optimal shape of the parts forming the manifolds, welding locations and welding sequence have been investigated. In addition, preliminary EBW tests have been performed in order to select the EBW conditions, and fundamental data on built-up shield have been obtained. Especially, welding deformation by joining the first wall panel to the shield has been measured, and total deformation to build-up shield by EBW has been found to be smaller than 2 mm. Consequently, the feasibility of fabrication technologies has been successfully demonstrated for a 1m-scaled box structure including the first wall with cooling channels by means of HIP, EBW and TIG (Tungsten Inert Gas arc)-welding. (author).

6907 (JAERI-Tech–94-011) **Design concept of a cryogenic distillation column cascade for a ITER scale fusion reactor.** Yamanishi, Toshihiko (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Enoeda, Mikio; Okuno, Kenji. Japan Atomic Energy Research Inst., Tokyo (Japan). Jul 1994. 37p. Order Number DE95737185. Source: OSTI; NTIS; INIS.

A column cascade has been proposed for the fuel cycle of a ITER scale fusion reactor. The proposed cascade consists of three columns and has significant features: either top or bottom product is prior to the other for each column: it is avoided to withdraw side streams as products or feeds of down stream columns: and there is no recycle steam between the columns. In addition, the product purity of the cascade can be maintained against the changes of flow rates and compositions of feed streams just by adjusting the top and bottom flow rates. The control system has been designed for each column in the cascade. A key component in the prior product stream was selected, and the analysis method of this key component was proposed. The designed control system never brings instability as long as the concentration of the key component is measured with negligible time lag. The time lag for the measurement considerably affects the stability of the control system. A significant conclusion by the simulation in this work is that permissible time for the measurement is about 0.5 hour to obtain stable control. Hence, the analysis system using the gas chromatography is valid for control of the columns. (author).

6908 (JAERI-Tech–94-012) **Critical element development of double seal door for tritium containment.** Kanamori, Naokazu (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Kakudate, Satoshi; Oka, Kiyoshi; Nakahira, Masataka; Taguchi, Kou; Obara, Kenjiro; Tada, Eisuke; Shibanuma, Kiyoshi; Seki, Masahiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 25p. Order Number DE95737221. Source: OSTI; NTIS; INIS.

In fusion experimental reactors, the in-vessel components such as blanket are activated due to D-T operation and they have to be assembled and replaced by remote operation through port penetration of plasma vacuum vessel. A double seal door is inevitably required at an interface between vacuum vessel port and maintenance cask in order to avoid the dispersion of tritium and activated dust during in-vessel component handling. The double seal door should have two open/close doors with four seal surfaces so as to keep leak tightness both of the vacuum vessel and the maintenance cask when doors closed, and to provide access space for handling in-vessel components when doors opened. A prototype compact double seal door with an attractive kinematics of parabolic trajectory has been proposed so as to minimize dead space for the door open/close operation, compared with ordinary slide or hinge type door. Based on this design concept, a sub-scaled model of double seal door with trapezoidal cross-section of around 0.2 m^2 has been fabricated. Through the preliminary experiments such as open/close performance, the double seal door mechanism with parabolic trajectory has been successfully demonstrated. As for leak tightness, seal characteristics of a polyimide ring irradiated up to 10 MGy have been measured. (author).

6909 (JAERI-Tech–94-013) **Hydrogen formation in metals and alloys during fusion reactor operation.** Zimin, S. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Takatsu, Hideyuki; Mori, Seiji. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 25p. Order Number DE95737224. Source: OSTI; NTIS; INIS.

The results of neutron transport calculations of the hydrogen formation based on the JENDL gas-production cross section file are discussed for some metals and alloys, namely ^{51}V, Cr, Fe, Ni, Mo, austenitic stainless steel (Ti modified 316SS:PCA), ferritic steel (Fe-8Cr-2W:F82H) and the vanadium-base alloy (V-5Cr-5Ti). Impact of the steel fraction in steel/water homogeneous blanket/shield compositions on the hydrogen formation rate in above-mentioned metals and alloys is discussed both for the hydrogen formation in the first wall and the blanket/shield components. The results obtained for the first wall are compared with those for the helium formation obtained at JAERI by the same calculational conditions. Hydrogen formation rates at the first wall having ^{51}V, Cr, Fe, Ni and Mo are larger than those of helium by 3-8 times. (author).

6910 (JAERI-Tech–94-015) **Shielding analysis of the ITER/EDA NBI duct.** Zimin, S. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Takatsu, Hideyuki; Sato, Satoshi; Tsunematsu, Toshihide; Inoue, Takashi; Ohara, Yoshihiro; Maki, Koichi. Japan Atomic Energy Research Inst., Tokyo (Japan). Aug 1994. 42p. Order Number DE95737222. Source: OSTI; NTIS; INIS.

This report discusses the shielding properties of the ITER/EDA NBI ducts based on the current JCT design of the 24 superconductive toroidal field coils (the 24 TFC). The two-dimensional transport calculations have been performed by DOT 3.5. First, the neutron fluxes, dose to insulator and peak nuclear heating rate were calculated in the TFC and the NBI duct. The X-Y calculational model with detail description of the neutron source shape and the TFC geometry is used for that calculation. Second, the R-Z calculational model with detail description of the NBI components was set up. The nuclear heating in the NBI cryo panels and displacement damage in NBI copper grids were obtained in that calculation. In summary, it it concluded that the shielding performance of the current NBI duct design is enough to decrease all considered neutronics responses below the limits. (author).

6911 (KFK–5271) **Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.** Dalle Donne, M. (ed.). As shown by recent developments beryllium has become one of the most important materials in the development of fusion reactors. It is practically the only neutron multiplier available for blankets with ceramic breeder materials and can be used with liquid metal breeders as well. It is one of the most likely materials to be used on the surface of the first walls and of the divertor. The neutron irradiation behavior of beryllium in a fusion reactor is not well know. Beryllium was extensively irradiated about 25-40 years ago and has been used since then in material testing reactors as reflector.

In the meantime, however, beryllium has been improved quite considerably. Today it is possible to obtain commercially beryllium which is much more isotropic and contains smaller ammounts of oxide. There are already indications that these new kinds of beryllium behave better under irradiation. (orig.)

6912 (KFK–5271, pp. 4-35) **Optimization of beryllium for fusion blanket applications.** Billone, M.C. (Fusion Power Program, Argonne National Lab., IL (United States)). The primary function of beryllium in a fusion reactor blanket is neutron multiplication to enhance tritium breeding. However, because heat, tritium and helium will be generated in and/or transported through beryllium and because the beryllium is in contact with other blanket materials, the thermal, mechanical, tritium/helium and compatibility properties of beryllium are important in blanket design. In particular, tritium retention during normal operation and release during overheating events are safety concerns. Accommodating beryllium thermal expansion and helium-induced swelling are important issues in ensuring adequate lifetime of the structural components adjacent to the beryllium. Likewise, chemical/metallurgical interactions between beryllium and structural components need to be considered in lifetime analysis. Under accident conditions the chemical interaction between beryllium and coolant and breeding materials may also become important. The performance of beryllium in fusion blanket applications depends on fabrication variables (e.g., grain size, porosity, and impurity content) and operational parameters (heat generation rate and temperature profile, tritium generation rate profile, helium generation rate profile, displacement damage rate profile, external stresses, etc.). First the properties database is reviewed to determine our state of knowledge of beryllium performance as a function of these variables. Several design calculations are then performed to indicate ranges of fabrication and operation variables that lead to optimum beryllium performance. Finally, areas for database expansion and improvement are highlighted based on the properties survey and the design sensitivity studies. (orig.)

This paper reviews the literature on beryllium, emphasizing the effects of irradiation on essential properties. Swelling and embrittlement experiments as a function of irradiation temperature and dose, and and as a function of neutron spectrum are described, and the results are quantified, where possible. Effects of impurity content are also reported, from which optimum composition specifications can be defined. Microstructural information has also been obtained to elucidate the processes controlling the property changes. The available information indicates that beryllium divertors can be expected to embrittle quickly and may need frequent replacement. (orig.)

The paper presents some studies on the mechanisms of dislocation formation in single crystalline Beryllium. Due to the low solubilities of only ppm for most of the impurity atoms in the Beryllium lattice, precipitation formation limits the single crystal growth very strictly. Therefore measurements with high sensitivity such as Rutherford Backscattering have been applied to find reliable estimations for absolute solubilities of the most critical impurities and for their local distribution with respect to defect arrangements such as subgrain boundaries. The strong mechanical anisotropy of the hexagonal Beryllium lattice is a key factor controlling the dislocation formation procedures during crystal growth and also during crystal annealing as well as during deformation procedures. (orig.)

6915 (KFK–5271, pp. 88-104) **Helium content and swelling of low temperature irradiated /post-irradiation annealed beryllium.** Sannen, L. (S.C.K./C.E.N., Mol (Belgium)); Moons, F.; Yao, Y. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. Beryllium specimens produced by vacuum hot pressing have been irradiated since 1980 in the material testing reactor BR2, up to a fast fluence of 4 x 10^{22} n/cm^2 (E > 1 MeV) at 40-50 C. The helium production and induced swelling of beryllium have been determined as a function of neutron fluence. The enhancement of the swelling as due to post-irradiation annealing up to 800 C for 24 h has also been evaluated and correlated with the neutron fluence and annealing temperature. The main experimental results are as follows : 1. Both irradiation swelling and helium content show a linear dependence on fast neutron fluence (E > 1 MeV) : the swelling rate amounts to 0.581 % per 10^{22} n/cm^2 fluence, and the helium production rate is 4880 appm/10^{22} n/cm^2. 2. The swelling after post-irradiation annealing can be correlated with the neutron fluence to the second power and with the annealing temperature to the fourth power. 3. The helium content measurements on the post-irradiation annealed specimens show that no helium is released during the annealing time considered (24 h max.) except at high temperature (800 C). (orig.)

The most important effects of neutron irradiation on beryllium are swelling, embrittlement and tritium retention. The helium produced by the ^{9}Be(n,2n)2 ^{4}He reaction is the cause of beryllium swelling which is the main limiting lifetime factor for the material. It was, therefore, decided to develop a computer code capable of describing the helium behaviour in beryllium; the approach used was to

modify an existing code available for the modelling of the UO_2 performance in fission reactors. The resulting code ANFIBE (ANalysis of Fusion Irradiated BEryllium) allows the calculation of gas distribution, induced swelling and helium release from beryllium. Good agreement between experimental and calculated swelling has been found. (orig.)

6917 (KFK–5271, pp. 120-137) **Tritium release studies of irradiated beryllium.** Baldwin, D.L. (Battelle, Pacific Northwest Lab., Richland, WA (United States)). Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. This presentation is a summary of Be studies, conducted at the Pacific Northwest Laboratory, relating stepped isothermal anneal tritium release measurements with thermal-ramp temperature programmed desorption measurements. Three ATR-irradiated Be specimens, covering the density range of 81% to 100% TD, have been tested by a stepped-thermal anneal technique. Data analysis of the tritium release curves using a diffusion/desorption model has yielded effective tritium diffusion coefficients, desorption-rate constants and the corresponding activation energies. The results from this model show diffusion to be the predominant rate-limiting mechanism under isothermal conditions with small and varying contribution by surface desorption. The 100% TD Be has also been tested by a thermal-ramp temperature-programmed desorption technique. Results from the stepped-thermal anneal and temperature-programmed desorption technique is summarized and compared. (orig.)

6918 (KFK–5271, pp. 138-148) **Long-time tritium release from irradiated beryllium (SIBELIUS irradiation).** Doerr, L. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

Tritium is produced in beryllium, which is used as neutron-multiplier in ceramic fusion blankets, by fast neutrons. Although the production rate is about two to three orders of magnitude smaller than that of the breeder ceramic, initial tritium release tests with beryllium samples from the SIBELIUS irradiation indicated that, because of the very slow release at typical blanket temperatures (400 - 700 C), the inventory might become large during the DEMO blanket lifetime ($\simeq$ 3 y). An extrapolation of the short-time (several days) tritium release tests to longer times is difficult because the inventory decrease with time is not exponential. Therefore a long-time annealing test with beryllium samples from the SIBELIUS irradiation has been started February 1993. Samples are purged and annealed up to 12 months at 380, 450, 550 and 650 C. Residual inventories after annealing are determined by purging and heating to 850 C. Results for not-annealed and 3-, respectively 6-month annealed samples are presented. (orig.)

6919 (KFK–5271, pp. 149-163) **Computer simulation of tritium retention and release in irradiated beryllium.** Dalle Donne, M. (Kernforschungszentrum Karlsruhe, Inst. fuer Neutronenphysik und Reaktortechnik (Germany)); Scaffidi-Argentina, F.; Ferrero, C.; Ronchi, C. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

The helium produced by the $^{9}Be(n,2n)2\,^{4}He$ and the oxygen impurities present in the material appear to be the main cause of tritium retention in irradiated beryllium. Because of the strong relation between the helium bubbles distribution and tritium release, it was decided to extend the code ANFIBE (ANalysis of Fusion Irradiated BEryllium), initially used to describe the helium induced swelling in beryllium, by including a new model describing the trapping effects on tritium due to chemical reactions with beryllium oxyde and capture in helium bubbles. The resulting modified code allows the calculation of tritium distribution and release from beryllium. Good agreement between calculated and experimental data was found. (orig.)

6920 (KFK–5271, pp. 164-171) **Research of beryllium safety issues.** Longhurst, G.R. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Anderl, R.A.; Dolan, T.J.; Hankins, M.R.; Pawelko, R.J. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

Beryllium has been identified as a leading contender for the plasma-facing material in ITER. Its use has some obvious advantages, but there are also a number of safety concerns associated with it. The Idaho National Engineering Laboratory (INEL) has undertaken a number of studies to help resolve some of these issues. One issue is the response of beryllium to neutron irradiation. We have tested samples irradiated in the Advanced Test Reactor (ATR) and are currently preparing to make measurements of the change in mechanical properties of beryllium samples irradiated at elevated temperatures in the Fast Flux Test Facility (FFTF) and the Experimental Breeder Reactor II (EBR-II) at the INEL. Mechanical tests will be conducted at the irradiation temperatures of 375-550 C. Other experiments address permeation and retention of implanted tritium in plasma-sprayed beryllium. In one test the porosity of the material allowed 0.12% of implanted ions and 0.17% of atoms from background gas pressure to pass through the foil with essentially no delay. For comparison, similar tests on fully dense hot-rolled, vacuum melted or sintered powder foils of high purity beryllium showed only 0.001% of implanting ions to pass through the foil, and then only after a delay of several hours. None of the molecular gas appeared to permeate these latter targets. An implication is that plasma-sprayed beryllium may substantially enhance recycling of tritium to the plasma provided it is affixed to a relatively impermeable substrate. (orig.)

6921 (KFK–5271, pp. 172-184) **Measurements of the heat transfer parameters of mixed beds of beryllium and lithium orthosilicate pebbles.** Dalle Donne, M. (Kernforschungszentrum Karlsruhe, Inst. fuer Neutronenphysik und Reaktortechnik (Germany)); Goraieb, A.; Sordon, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

The Karlsruhe solid breeder blanket design for the DEMO is based on the use of a mixed bed of 2 mm beyllium and 0.1 - 0.2 mm Li_4SiO_4 pebbles with and without 0.08 - 0.18 mm beryllium pebbles. This arrangement allows to withstand better the neutron

irradiation effects on beyllium (swelling, embrittlement). The proposed mixed beds should have high heat transfer parameters (thermal conductivity, wall heat transfer coefficient) due to the high packing factor (≈ 80 %) and to the fact that the contact between the high conducting metallic pebbles is maintained. This is important, because the maximum pebble bed temperature in the blanket should be less than 700 C. The bed heat transfer parameters have been measured in an annular test section having on the axis an electrically heated rod. Three beds have been investigated: a bed of 2 mm beryllium pebbles, a mixed bed with 2 mm beryllium pebbles and 0.1 - 0.2 mm Li_4SiO_4 pebbles and a mixed bed with 2 mm beryllium pebbles and a mixture of 50 % 0.1 - 0.2 mm Li_4SiO_4 and 50 % 0.08 - 0.18 mm beryllium pebbles. The measurements have confirmed that the heat transfer parameters of the mixed beds, especially those of the bed with the small beryllium pebbles, are considerably higher than those of the bed with the 2 mm beryllium pebbles. (orig.)

6922 (KFK–5271, pp. 185-199) **Beryllium research activity in JAERI.** Kawamura, Hiroshi (Japan Atomic Energy Research Inst., Oarai Research Establishment, Ibaraki (Japan)); Ishitsuka, Etsuo. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

The present status of Beryllium study in JAERI will be presented in this work. Some new programs are attempting in JAERI; compression test, vacuum heating, so on. The low impurity and low cost pebble production were developed by using improved rotating electrode method. The thermal expansion coefficient and specific heat of the unirradiated pebble samples were measured by the laser interferometer and differential scanning calorimetry (DSC), respectively. These thermal properties were almost corresponded with the balk beryllium. The compression test was conducted for the evaluation of mechanical property. The irradiated pebbles of total first neutron fluence of 1.3×10^{25}(n/m^2) were tested at the room temperature. The embrittlement of irradiated beryllium pebbles was found from these results. (orig.)

6923 (KFK–5271, pp. 200-218) **Compatibility between beryllium and stainless steel.** Kato, M. (NGK Insulator Co., Ltd., Aichi (Japan)); Kawamura, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

Beryllium has been used for the neutron multiplier in fusion blanket, and inserted into the structural material. And, 316 Stainless Steel has been proposed as the structural material. However, the elementary process of reaction between beryllium and 316SS did not clear in detail. Therefore, we conducted the diffusion couple test in order to make clear the elementary process of reaction between beryllium and 316SS. The combinations of the diffusion couple were three kinds, i.e., Be/316SS, Be/Fe.Cr alloy and Be/Ni. Each diffusion couples was sealed in capsule with high purity Helium(6N) by TIG welding, and was annealed for 100, 300 and 1000h per at each temperature, i.e. 400, 600 and 800 C. (orig.)

6924 (KFK–5271, pp. 219-232) **Compatibility between beryllium and ceramic coating film.** Kawamura, H. (Japan Atomic Energy Research Inst., Oarai Research Establishment, Ibaraki (Japan)); Kato, M.; Miyajima, K. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

Beryllium is indispensable for fusion blanket as the neutron multiplier and inserted into the structural material(316SS) on Japanese blanket concept. In this case, chemical interaction between beryllium and 316SS has been observed above 600 C, and BeNi was formed on 316SS side at this temperature. Therefore, we are considering a chromic oxide coating on 316SS surface as the diffusion barrier of beryllium into 316SS, because the reaction between beryllium and chromium was not observed and the component of this coating film did not contain nickel. From the results, it made clear that ceramic coating film(50 μ m) had a function as reaction barrier completely against 316SS at 800 C -300h annealing similar to 600 C -1000h annealing. (orig.)

6925 (KFK–5271, pp. 233-251) **Properties of beryllium as a plasma facing material.** Eckstein, W. (Max-Planck-Inst. fuer Plasmaphysik, Garching (Germany)); Behrisch, R.; Scherzer, B.M.U.; Roth, J. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Plasma spraying is being investigated as a potential coating technique for applying thin (0.1-5mm) layers of beryllium on plasma facing surfaces of blanket modules in ITER and also as an in-situ repair technique for repairing eroded beryllium surfaces in high heat flux divertor regions. High density spray deposits (>98% of theoretical density) of beryllium will be required in order to maximize the thermal conductivity of the beryllium coatings. A preliminary investigation was done to determine the effect of various processing parameters (particle size, particle morphology, secondary gas additions and reduced chamber pressure) on the as-deposited density of beryllium. The deposits were made using spherical beryllium feedstock powder which was produced by centrifugal atomization at Los Alamos National Laboratory (LANL). Improvements in the as-deposited densities and deposit efficiencies of the beryllium spray deposits will be discussed along with the corresponding thermal conductivity and outgassing behavior of these deposits. JET has operated with large areas of beryllium exposed to plasma in both the limiter and divertor configuration. Tests to beryllium tiles proposed for the inertial Pumped Divertor of JET suggest that castellations of 6 x 6 mm are required to sustain heat fluxes of up to 15 MW/m^2 for 5 x 10^3 pulses and no appreciable fatigue failure of the irradiated surface. However, at 27 MW/m^2 fatigue cracks appeared lateral to the irradiated surface and these cracks cause the surface to melt without fatigue failure of the hot areas. There may be a strong dependence of fatigue life of beryllium on the initial temperature of the component. (orig.)

The intent of this effort was to demonstrate that ingot metallurgy (IM) beryllium (Be) can be bonded to dissimilar metals such as copper (Cu) or vanadium (V) at low temperatures by using silver (Ag) as a bonding aid. It is hoped that success at the coupon stage will stimulate more extensive studies of the mechanical and thermal integrity of such joints, leading ultimately to use of this technology to fabricate first wall structures for ITER. (orig.)

6929 (KFK–5271, pp. 307-318) **The feasibility of beryllium as structural material for the ITER plasma-facing components (PFC).** Vieider, G.; Cardella, A.; Gorenflo, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. Be as plasma-facing armour has attractive features including excellent plasma compatibility, no T-retention via co-deposition and the potential for in-situ repair via plasma spraying. In order to avoid the bonding of the Be-armour to a heatsink structure in e.g., Cu-alloys, the ITER Joint Central Team (JCT) proposed for the divertor tubular elements with monolithic Be, both as plasma-facing and structural material. The analysis of these Be-tubes with 5 mm wall thickness at a heat load of 5 MW/m^2 showed that even for the most favourable assumptions thermal stresses exceed by far the allowed values according to design codes. Damage by neutrons and disruptions would worsen further the case for Be as monolithic plasma-facing and structural material. For PFC at heat flux significantly above 1 MW/m^2 it appears evident that Be should be used merely as armour bonded to a suitable structural material as heatsink. (orig.)

6930 (KFK–5271, pp. 319-330) **Laser desorption and depth profiling study of hydrogen and deuterium implanted in beryllium.** Keroack, D. (INRS-Energie et Materiaux, Univ. du Quebec, Varennes, PQ (Canada)); Schiettekatte, F.; Terreault, B.; Ross, G.G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. IEA Implementing Agreement for a Programme of Research and Development on Fusion Materials.* 349p. Order Number DE95726893. Source: OSTI; NTIS (US Sales Only); INIS.

Pulsed laser desorption was used to investigate the reemission of deuterium implanted in beryllium. The amount of H_2 or D_2 molecules released and the evolution of the H and D depth profiles as a function of the laser energy density was measured on samples with different implantation energies and doses. Numerical modelling of our results indicates that detrapping and diffusion are the limiting processes. At low fluence the data are best fitted with second order detrapping with a trap energy of 1.7 $\pm$ 0.1 eV and the effective diffusion coefficient is described by the equation $D = (8 \pm 1) \times 10^{-4} \exp(-0.32 \pm .02\ eV/kT)\ cm^2/s$. At high fluence the detrapping energy is $\leq$1 eV/molecule and extremely rapid migration has to be considered. The transition between these two regimes corresponds approximately to the fluence for which blistering becomes detectable. (orig.)

6931 (KFK–5271, pp. 331-341) **Thermal desorption of implanted helium from beryllium.** Zakaria, Y.M. (Dept. of Engineering Physics, McMaster Univ., Hamilton, ON (Canada)); Macaulay-Newcombe, R.G.; Thompson, D.A. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Association Euratom-Kernforschungszentrum Karlsruhe GmbH (KFK) (Germany). Dec 1993. (CONF-9310182–: Workshop on beryllium for fusion applications, Karlsruhe (Germany), 4-5 Oct 1993). In *Workshop on beryllium for fusion applications. Proceedings. Hot isostatic pressed foils of 99.5 wt.% beryllium have been implanted at room temperature with 30 keV helium to fluences ranging from 10^{20} to 10^{21} He$^+$/m^2. Linear ramp thermal desorption measurements up to 1073 K ($\approx$ 0.7 T_m) were performed to study the mechanisms by which the helium is trapped. Some of the samples have been deliberately corroded to investigate the effect of the surface contamination on the helium release. (orig.)

6932 (LA-UR–94-3945) **Hydrodynamic instabilities in inertial confinement fusion.** Hoffman, N.M. Los Alamos National Lab., NM (United States). [1994]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9408127–5: 45. Scottish Universities summer school in physics, Fife (United Kingdom), 7-20 Aug 1994). Order Number DE95003663. Source: OSTI; NTIS; INIS; GPO Dep.

The focus of the paper is on buoyancy-driven instabilities of the Rayleigh-Taylor type, which are commonly regarded as the most important kind of hydrodynamic instability in inertial-confinement-fusion implosions. The paper is intended to be pedagogical rather than research-oriented, and so is by no means a comprehensive review of work in this field. Rather, it is hoped that the student will find here a foundation on which to build an understanding of current research, and the experienced researcher will find a compilation of useful results. The aim of the paper is to discuss the evolution of a single Rayleigh-Taylor-unstable mode, from its linear phase to its late-stage constant-velocity bubble growth, with a brief consideration of the saturation of linear growth. The influence of other modes in invoked only in the short-range sense (in wavenumber space) of the Haan saturation model. Owing to limitations of space, the treatment of other instabilities such as Richtmyer-Meshkov and Kelvin-Helmholtz is necessarily very brief, and entirely inadequate as an introductory discussion. Likewise, there is no reference to the effect of convergent geometry, to long-range mode coupling, or to shape effects in three-dimensional growth. Furthermore, there is no reference to the large body of experimental research related to hydrodynamic instabilities.

6933 (LBL–35960) **High current induction linacs.** Barletta, W.; Faltens, A.; Henestroza, E.; Lee, E. Lawrence Berkeley Lab., CA (United States). Jul 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (HIFAN–666; CONF-9407103–32: International conference on

accelerator-driven transmutation technologies and applications, Las Vegas, NV (United States), 25-28 Jul 1994). Order Number DE95003442. Source: OSTI; NTIS; INIS; GPO Dep.

Induction linacs are among the most powerful accelerators in existence. They have accelerated electron bunches of several kiloamperes, and are being investigated as drivers for heavy ion driven inertial confinement fusion (HIF), which requires peak beam currents of kiloamperes and average beam powers of some tens of megawatts. The requirement for waste transmutation with an 800 MeV proton or deuteron beam with an average current of 50 mA and an average power of 40 MW lies midway between the electron machines and the heavy ion machines in overall difficulty. Much of the technology and understanding of beam physics carries over from the previous machines to the new requirements. The induction linac allows use of a very large beam aperture, which may turn out to be crucial to reducing beam loss and machine activation from the beam halo. The major issues addressed here are transport of high intensity beams, availability of sources, efficiency of acceleration, and the state of the needed technology for the waste treatment application. Because of the transformer-like action of an induction core and the accompanying magnetizing current, induction linacs make the most economic sense and have the highest efficiencies with large beam currents. Based on present understanding of beam transport limits, induction core magnetizing current requirements, and pulse modulators, the efficiencies could be very high. The study of beam transport at high intensities has been the major activity of the HIF community. Beam transport and sources are limiting at low energies but are not significant constraints at the higher energies. As will be shown, the proton beams will be space-charge-dominated, for which the emittance has only a minor effect on the overall beam diameter but does determine the density falloff at the beam edge.

6934 (NIFS-MEMO–13) **Electron beam irradiation test facility for research and development of plasma facing components.** Kubota, Yusuke; Noda, Nobuaki; Sagara, Akio; Inoue, Noriyuki; Akaishi, Kenya; Motojima, Osamu. National Inst. for Fusion Science, Nagoya (Japan). Mar 1994. 59p. (In Japanese). Order Number DE95737218. Source: OSTI; NTIS; INIS.

To develop a reliable divertor plate for large helical device(LHD), a test facility called ACT(Active Cooling Teststand) has been constructed in Toki site. The facility can generate 100 kW electron beams with beam energy of 30 keV as a heat source, which can irradiate with a heat flux of up to 100 MW/m^2 to a test sample piece steadily. The beam irradiation area on the sample can be changed from 1 to 400 cm^2 with a 64 step controller electrically. By using the ACT, the thermal fatigue tests of various kinds of carbon-copper brazed components are being performed under the heat loads of 2.5-14 MW/m^2. The test results show that several brazed components are applicable as the divertor plates for the first stage of LHD operation, namely with maximum heat load of 10 MW/m^2 for 5 seconds discharge durations. (author).

6935 (SAND–94-1419C) **Pulsed power drivers for ICF and high energy density physics.** Ramirez, J.J.; Matzen, M.K.; McDaniel, D.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9411152–1: International Atomic Energy Agency (IAEA) technical committee meeting on drivers for inertial confinement fusion, Paris (France), 14-18 Nov 1994). Order Number DE95003361. Source: OSTI; NTIS; INIS; GPO Dep.

Nanosecond Pulsed Power Science and Technology has its origins in the 1960s and over the past decade has matured into a flexible and robust discipline capable of addressing key physics issues of importance to ICF and high Energy Density Physics. The major leverage provided by pulsed power is its ability to generate and deliver high energy and high power at low cost and high efficiency. A low-cost, high-efficiency driver is important because of the very large capital investment required for multi-megajoule ignition-class systems. High efficiency is of additional importance for a commercially viable inertial fusion energy option. Nanosecond pulsed power has been aggressively and successfully developed at Sandia over the past twenty years. This effort has led to the development of unique multi-purpose facilities supported by highly capable diagnostic, calculational and analytic capabilities. The Sandia Particle-beam Fusion Program has evolved as part of an integrated national ICF Program. It applies the low-cost, high-efficiency leverage provided by nanosecond pulsed power systems to the longer-term goals of the national program, i.e., the Laboratory Microfusion Facility and Inertial Fusion Energy. A separate effort has led to the application of nanosecond pulsed power to the generation of intense, high-energy laboratory x-ray sources for application to x-ray laser and radiation effects science research. Saturn is the most powerful of these sources to date. It generates ~500 kilojoules of x-rays from a magnetically driven implosion (Z-pinch). This paper describes results of x-ray physics experiments performed on Saturn, plans for a new Z-pinch drive capability for PBFA-II, and a design concept for the proposed ~15 MJ Jupiter facility. The opportunities for ICF-relevant research using these facilities will also be discussed.

6936 (UCRL-ID–117884) **Use of the National Ignition Facility for defense, energy, and basic research science.** Logan, B.G. Lawrence Livermore National Lab., CA (United States). 15 Jul 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95002319. Source: OSTI; NTIS; GPO Dep.

On January 15, 1993, the Department of Energy (DOE) approved the Justification for Mission Need (JMN) for the National Ignition Facility (NIF). This action (Key Decision Zero, or KD0) commenced the conceptual design for the facility, which has resulted in a recently completed Conceptual Design Report (CDR). The JMN document defined the NIF mission elements to include laboratory fusion ignition and energy gain, weapons physics, and nuclear weapons effects testing research (NWET). NIF has a dual benefit by contributing to inertial fusion energy (IFE), industrial technology development, new basic science areas applying high power lasers, and training young scientists for future stewardship activities. For consideration of the next DOE action, Key Decision One (KD1), all mission elements of the NIF as stated in the JMN are consistent with and important to the US stockpile stewardship program, and are expected to continue to be in the vital interest of the United States for the long term. This document provides further information on the utility of NIF for stockpile stewardship, including support for a Comprehensive Test Ban Treaty (CTBT), and specific findings of four national workshops on the NIF utility for weapons physics, NWET, IFE and basic science research. The role of NIF for stockpile stewardship has been refined since a DOE meeting in Albuquerque, NM Feb. 1–2, 1994. The possible compliance of NIF research with anticipated CTBT and NPT limitations was discussed at the DOE Office of Arms Control and Nonproliferation in Washington, DC on March 8, 1994.

6937 (UCRL-ID–118982) **Using and programming the SUPERCODE.** Haney, S.W. Lawrence Livermore National Lab., CA (United States). 8 Jun 1994. 304p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95004342. Source: OSTI; NTIS; GPO Dep.

SUPERCODE is a systems code used in designing tokamak devices and reactors. This report is divided into 4 chapters. Chapter one covers installing the code and directory organization. The execution of the code, command line editing and history, the shell language, classes, and shell input and output are discussed in chapter two. Chapter three covers the writing modules. In chapter four, the Consts module, Sys module, and Plot module are covered. At the end of the report, the need and use of SUPERCODE are summarized.

6938 (UCRL-JC–115491) **UEDGE and DEGAS modeling of the DIII-D scrape-off layer plasma.** Genstermacher, M.E. (Lawrence Livermore National Lab., CA (United States)); Porter, G.D.; Rensink, M.E.; Rognlien, T.D.; Allen, S.L.; Hill, D.N.; Lasnier, C.J.; Leonard, T.; Petrie, T. Lawrence Livermore National Lab., CA (United States); General Atomics, San Diego, CA (United States). May 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-89ER51114. (CONF-940580–23: 11. international conference on plasma surface interactions in controlled fusion devices, Mito (Japan), 23-27 May 1994). Order Number DE95003652. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of work to develop benchmarked theoretical models of scrape-off-layer (SOL) characteristics in diverted tokamaks by comparing shot simulations using the UEDGE plasma fluid and DEGAS Monte-Carlo neutral particle transport codes to measurements of the DIII-D SOL plasma. The available experimental data include the radial profiles of electron density and temperature, the ion temperature, the divertor exhaust power, the intensity of H_α emission, and profiles of the radiated power. A very simple model of the anomalous perpendicular transport rates produces consistency between the calculated and measured radial profiles of the divertor power, and of the midplane densities and temperatures. Experimentally, measured exhaust power is now typically 80–90% of the input power. The simulated peak power on the outer leg of the divertor floor is now within about 20% of the measured power. Various sensitivities of the simulation and measurement comparisons to model assumptions are described. Finally, these benchmarked models have been used to examine the effects of various baffle configurations for the Radiative Divertor Upgrade in DIII-D.

6939 (UCRL-JC–115492) **Divertor design for the Tokamak Physics Experiment.** Hill, D.N. (Lawrence Livermore National Lab., CA (United States)); Braams, B.; Brooks, J.N. Lawrence Livermore National Lab., CA (United States); Princeton Univ., NJ (United States). Plasma Physics Lab. May 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC02-76CH03073. (CONF-940580–22: 11. international conference on plasma surface interactions in controlled fusion devices, Mito (Japan), 23-27 May 1994). Order Number DE95003653. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we discuss the present divertor design for the planned TPX tokamak, which will explore the physics and technology of steady-state (1000s pulses) heat and particle removal in high confinement (2–4 × L-mode), high beta ($\beta_N \geq 3$) divertor plasmas sustained by non-inductive current drive. The TPX device will operate in the double-null divertor configuration, with actively cooled graphite targets forming a deep (0.5 m) slot at the outer strike point. The peak heat flux on, the highly tilted (74° from normal) re-entrant (to recycle ions back toward the separatrix) will be in the range of 4–6 MW/m^2 with 18 MW of neutral beams and RF heating power. The combination of active pumping and gas puffing (deuterium plus impurities), along with higher heating power (45 MW maximum) will allow testing of radiative divertor concepts at ITER-like power densities.

6940 (UCRL-JC–116030) **Target injection methods for inertial fusion energy.** Petzoldt, R.W.; Moir, R.W. Lawrence Livermore National Lab., CA (United States). Jun 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940630–52: 11. topical meeting on the technology of fusion energy, New Orleans, LA (United States), 19-24 Jun 1994). Order Number DE95003654. Source: OSTI; NTIS; INIS; GPO Dep.

We have studied four methods to inject IFE targets: the gas gun, electrostatic accelerator, induction accelerator, and rail gun. We recommend a gas gun for indirect drive targets because they can support a gas pressure load on one end and can slide along the gun barrel without damage. With the gas gun, the amount of gas required for each target (about 10 to 100 mg) is acceptable; for other types of targets, a sabot would be necessary. A cam and poppet valve arrangement is recommended for gas flow control. An electrostatic accelerator is attractive for use with lightweight spherical direct drive targets. Since there is no physical contact between the target and the injector, there will be no wear of either component during the injection process. An induction accelerator has an advantage of no electrical contact between the target and the injector. Physical contact is not even necessary, so the wear should be minimal. It requires a cylindrical conductive target sleeve which is a substantial added mass. A rail gun is a simpler device than an electrostatic accelerator or induction accelerator. It requires electrical contact between the target and the rails and may have a significant wear rate. The wear in a vacuum could be reduced by use of a solid lubricant such as MoS_2. The total required accuracy of target injection, tracking and beam pointing of ±0.4 mm appears achievable but will require development and experimental verification.

6941 (UCRL-JC–117669) **Flow-through Z-pinch study for radiation generation and fusion energy production.** Hartman, C.W. (Lawrence Livermore National Lab., CA (United States)); Eddleman, J.L.; Moir, R.; Shumlak, U. Lawrence Livermore National Lab., CA (United States). 20 Jun 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940630–51: 11. topical meeting on the technology of fusion energy, New Orleans, LA (United States), 19-24 Jun 1994). Order Number DE95004209. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss a high-density fusion reactor which utilizes a flow-through Z pinch magnetic confinement configuration. Assessment of this reactor system is motivated by simplicity and small unit size (few hundred MWe) and immunity to plasma contamination made possible at high density. The type reactor discussed here would employ a liquid Li vortex as the first wall/blanket to capture fusion neutrons with minimum induced radioactivity and to achieve high wall loading and a power density of 200 w/cm^3.

6942 (UCRL-JC–118496) **The physics design of the Tokamak Physics Experiment.** Thomassen, K.I. (Lawrence Livermore National Lab., CA (United States)); Batchelor, D.B.; Bialek, J. Lawrence Livermore National Lab., CA (United States). 8 Aug 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940933–16: 15. international conference on plasma physics and controlled nuclear fusion research, Seville (Spain), 26 Sep - 1 oct 1994). Order Number DE95003649. Source: OSTI; NTIS; INIS; GPO Dep.

The physics approaches to improved, steady-state tokamak reactors, as evolved through reactor design studies, ideas based on experimental results, and better theoretical understanding, are the foundation for the mission and physics design of the Tokamak Physics Experiment (TPX). The mission of TPX is to develop the scientific basis for cost-competitive, continuously operating tokamak power plants. We report here the design status of TPX, a device optimized to achieve improved performance through strong plasma shaping, recycling control, and current profile shaping, while operating continuously. The design incorporates poloidal field flexibility for a wide range of operation in normalized beta and internal inductance, a double-null "Vee" divertor configuration for power and particle control, internal and external $n \neq 0$ coils, as well as passive stabilizers, for control of MHD activity, and remote maintenance for continuous high-power operation in deuterium. Having superconducting poloidal and toroidal coils, the TPX device itself is capable of continuous operation, although initially auxiliary equipment limits the pulse length to 1000 sec.

6944 (DOE/ER/75776–T1) **Attracting students and professionals into math, science, and technology education at the elementary and middle grades: Annual report, September 1, 1992–August 31, 1993.** Flick, L.B. Washington State Univ., Pullman, WA (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER75776. Order Number DE95004295. Source: OSTI; NTIS; GPO Dep.

This report describes the progress of a project to encourage students and professionals to participate in math, science, and technology education at the elementary and middle grades. The topics of the report include developing a model laboratory/classroom for teacher education, providing financial incentives for students with technical majors to complete the program, and emphasizing issues of equity and minority participation in mathematics, science and technology education through recruitment procedures and in course content.

6945 (DOE/ER/75776–T2) **Attracting students and professionals into math, science, and technology education at the elementary and middle grades: Final report, September 1, 1992–February 28, 1994.** Flick, L.B. Washington State Univ., Pullman, WA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER75776. Order Number DE95004296. Source: OSTI; NTIS; GPO Dep.

This report describes the progress of a project to encourage students and professionals to participate in math, science, and technology education at the elementary and middle grades. The topics of the report include documenting activities and procedures for the purposes of evaluation and dissemination of descriptive information, generating case studies of the students going through this program to provide research and evaluation data on the process of attracting technically qualified people into elementary and middle school teaching, establishing a program of mentoring between scientists, engineers, and mathematicians and prospective teachers in the program, and establishing a program of mentoring between master teachers in area schools and prospective teachers.

6946 (DOE/HR–0098) **Department of Energy 1977–1994: A summary history.** Energy history series. Fehner, T.R.; Holl, J.M. USDOE Office of Administration and Human Resource Management, Washington, DC (United States). History Div. Nov 1994. 142p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Department of Energy Organization Act of 1977 created perhaps the most interesting and diverse agency in the Federal Government. The new department brought together for the first time not only most of the government's energy programs but also defense responsibilities that included the design, construction, and testing of nuclear weapons. The Department of Energy incorporated a score of organizational entities from a dozen departments and agencies, each with its own history and traditions. Uniting these seemingly disparate entities and programs was a common commitment to performing first rate science and technology. The Department of Energy sought–and continues to seek–to be one of the Nation's premier science and technology organizations. The Department of Energy, 1977–1994, is a summary history of the origins, goals, and achievements of the Department and selected major programs. Beginning with the various fuels policies on the energy side and the Manhattan project on the defense side, the study details how the Department was born of the energy crisis of the early and mid-1970s. The history then surveys the Department and its programs from the Carter through the Clinton administrations. As the energy crisis eased, the Department played a central role on issues as dissimilar as the Strategic Defense Initiative and the Superconducting Super Collider. With the end of the Cold War, the Department of Energy further transformed itself, moving from the building of bombs to partial dismantlement of the nuclear weapons complex and to an increased emphasis on environmental activities and technology transfer efforts.

6947 (LA-UR–94-3653) **Color orthophotography: To scan or not.** Benson, J.L. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950364–1: 1994 ASPRS/ACSM technical program, Bethesda, MD (United States), 2 Mar 1995). Order Number DE95002749. Source: OSTI; NTIS; GPO Dep.

A picture is worth a thousand words, which explains why digital orthophotographs have become such a popular item. Today, most procurement of orthophotographs result in a digital product. However, if one already has hard copy orthophotography, should one scan them, or have them produced as true digital orthophotographs? What are the advantages and disadvantages of each methodology? This paper examines the procedure the Facility for Information Management, Analysis, and Display (FIMAD) at Los Alamos National Laboratory (LANL) uses to determine the appropriate product based on our needs. The scanned product is compared to a digitally produced orthophotograph, procured through a vendor. Comparison is performed on the screen, on hard copy output, and by spectral analysis in the red, green and blue bands. Full screen sized images look fairly good, but when enlarged, the scanned image appeared blocky and fuzzy. Hard copy output from the electrostatic plotter produces colors similar to the screen for the demo image, but renders poor color matching with the scanned image. Histograms of each band of the scanned image show a high count at the low end of the curve. These findings confirm that the images are different, and that the differences are not just in the eyes of the beholder. It was concluded true digital orthophotographs are needed.

6948 (UCRL–52000-94-8/9) **Energy and Technology Review, August–September 1994.** Bookless, W.A. Lawrence Livermore National Lab., CA (United States). [1994]. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95004248. Source: OSTI; NTIS; GPO Dep.

This issue contains an overview on materials by computer design; research highlights on using computers to build better computers, modeling large molecular systems, massively parallel computing CRADA, designing better microelectronics devices, and polymeric nitrogen for storing energy; and feature articles on nanotribology (modeling atoms when surfaces collide), understanding material surfaces and interfaces, and predicting the structural and electronic properties of scintillators. The feature articles are processed separately for the database.

6949 (DOE/IG–0001/95) **US Department of Energy Office of Inspector General semiannual report to Congress, April 1–September 30, 1994.** USDOE Office of Inspector General, Washington, DC (United States). Oct 1994. 84p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003981. Source: OSTI; NTIS; GPO Dep.

This Office of Inspector General Semiannual Report to the Congress covers the period from April 1 through September 30, 1994. The report summarizes significant audit, inspection and investigate accomplishments for the reporting period, a large portion of which evaluated management controls that the Department of Energy uses to ensure efficient and effective operation of its programs. During this reporting period, the Office of Inspector General issued 64 audit and 15 inspection reports. The Office of Inspector General also provided 11 investigative referrals to management for recommended positive action. As a result of audits of contract costs, the Office of Inspector General questioned $553,852 in costs. Management committed to taking corrective actions which the Office of Inspector General estimates will result in a more efficient use of funds totaling $467 million. For reports issued during the period, the Office of Inspector General made audit recommendations that, when implemented by management, could result in $568 million being put to better use. In addition, the Office of Inspector General's investigations led to 16 criminal convictions and one pretrial diversion, as well as criminal and civil prosecutions which resulted in fines and recoveries of $160,301,663.

6950 (DOE/IG–0360) **Audit of the transfer of government-owned property at the Mound and Pinellas Plants.** USDOE Office of Inspector General, Washington, DC (United States). Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

This report addresses the audit of the transfer of government-owned property at the Mound and Pinellas Plants. The end of the Cold War brought many changes to the Department of Energy (Department), including the reconfiguration of defense program activities and the closure of some operations. Public Law 103-160 allows the Department to transfer or lease, under specified conditions, Department-owned personal property to economic development initiatives. By encouraging economic development, the Department hopes to mitigate adverse impacts that plant closures would have on local economies. The objective of the audit was to determine whether the Department's interests were properly protected with regard to the transfer of equipment from weapons

production use to economic development initiatives. The Mound Plant (Mound) and the Pinellas Plant (Pinellas) did not have property disposition plans that would properly protect Departmental interests. Specifically, Mound planned to make about $13.2 million of Government-owned property available to private businesses even through the property was needed by Defense Programs at other facilities and would cost less than $1 million to relocate. In addition, Mound and Pinellas planned to make available to economic development initiatives several hundred million dollars of Government-owned property without first determining whether it was needed by other Departmental elements. These conditions existed because neither Headquarters nor the Albuquerque Operations Office provided Mound and Pinellas adequate guidance, and Mound and Pinellas management believed that economic development initiatives could take precedence over some Departmental programs.

6951 (DOE/IG–0362) **Audit of light vehicle fleet management in the Department of Energy.** USDOE Office of Inspector General, Washington, DC (United States). Dec 1994. 21p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

This report addresses the audit of light vehicle fleet management in the Department of Energy (DOE). The DOE is responsible for managing its overall vehicle fleet operations, including the light vehicle fleet. The DOE's two methods of fleet operations are to use vehicles that are owned and managed by the DOE, or to use vehicles that are leased from outside sources such as the General Services Administration (GSA), but still managed by the DOE. The objective of this audit was to evaluated the economy and efficiency of the DOE's light vehicle operations. The audit disclosed that the Department was not managing its light vehicle fleet operations in the most economical and efficient manner. Even through DOE operations offices established local use standards which were substantially below suggested Department guidelines, about 46% of the vehicles reviewed (5,999) did not meet these lower utilization standards. Further, analyses at selected DOE sites showed that GSA owned fleets were more economical and efficient than DOE owned fleets. These conditions occurred because neither the DOE nor its operations offices were effectively monitoring vehicle utilization of ensuring that vehicle operations were conducted in the most economical and efficient manner. In the auditors' opinion, a 10% reduction in the light vehicle fleet could potentially save the DOE $7 million in vehicle acquisition costs and $3 million annually in reduced operating and maintenance costs, subject to certain offsetting costs discussed in the report. The auditors recommended that the DOE monitor vehicle utilization to ensure that the minimum number of vehicles are retained to meet mission needs, and determine and use the most economical and efficient method of operating the vehicle fleets. Management generally concurred with the findings and recommendations, and provided information on planned corrective actions.

6952 (DOE/IG–0363) **Inspection of administrative management procedures for legal services acquired by selected management and operating contractors.** USDOE Office of Inspector General, Washington, DC (United States). Dec 1994. 46p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The initial purpose of this inspection was to evaluate the administrative management of legal services relating to civil litigation acquired by Rockwell International Corporation (Rockwell) under the Management and Operating (M and O) Contract No. DE-AC04-76DP03533. This contract was for the operation of the Rocky Flats Plant, and Rockwell's continuing obligations under this contract are being administered by the Albuquerque Operations Office for the purpose of closing out Rockwell's activities at Rocky Flats. In order to determine whether the findings generally applied to other DOE sites, the auditors also conducted a limited evaluation of the management procedures relating to legal services for three other selected M and O contractors. The purpose of this inspection was to evaluate: (1) Rockwell's acquisition and administration of legal services associated with civil litigation of Rocky Flats under Contract No. DE-AC04-76DP03533, and the processes used by Rockwell and the Albuquerque Operations Office (Albuquerque) for reviewing the cost of these services under DOE's voucher system prior to payment. (2) The acquisition and administration of outside legal services at Los Alamos National Laboratory (LANL), Lawrence Livermore National Laboratory (LLNL), and Sandia National Laboratories (SNL), Albuquerque. (3) The March 23, 1994, DOE Litigation Management Procedures as they relate to the management to litigation involving Management and Operating contractors.

6953 (INIS-mf–14418) **Guidebook on training to establish and maintain the qualification and competence of nuclear power plant operations personnel.** Bezpecnost Jadernych Zarizeni, no.6. Statni Urad pro Jadernou Bezpecnost, Prague (Czech Republic). 1994. 197p. Translation of IAEA TECDOC 525, Vienna, 1989. (In Czech). Order Number DE95611424. Source: OSTI; NTIS (US Sales Only); INIS.

Since the IAEA published its Guidebook on the Qualification of Nuclear Power Plant Operations Personnel in 1984 (Technical Reports Series 242) there have been important developments in the approach to training adopted by many operating organizations in different countries. It is now accepted that developing training programmes based solely on experience is inappropriate for the nuclear power industry, and that a systematic approach to training is necessary. It has been recognized that inadequate knowledge and skills may lead to human errors, and it is therefore necessary to review and improve the development and implementation of initial and continuing training programmes. The present Guidebook proposes an approach which is comprehensive and systematic in its methodology and also cost effective in its implementation. This Guidebook is mainly intended for management and training staff of nuclear power plant operating organizations. Relevant examples of current training practices are presented in the Appendices, which constitute an integral part of the Guidebook. (author).

6954 (INS-T–529) **VHS-tape system for general purpose computer. For next generation mass storage system.** Ukai, K.; Takano, M.; Shinohara, M.; Niki, K.; Suzuki, Y.; Hamada, T.; Ogawa, M. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Jul 1994. 24p. (In Japanese). Order Number DE95737268. Source: OSTI; NTIS; INIS.

Mass storage is one of the key technology of next generation computer system. A huge amount of data is produced on a field of particle and nuclear physics. These data are raw data of experiments, analysis data, Monte Carlo simulations data, etc. We search a storage device for these data at the point of view of capacity, price, size, transfer speed, etc. We have selected a VHS-tape (12.7 mm-tape, helical scan) from many storage devices. Characteristics of the VHS-tape are as follows; capacity of 14.5 GB, size of 460 cm^3, price of 1,000 yen (S-VHS tape for video use), and 1.996 MB/sec transfer speed at a sustained mode. Last year, we succeeded to operate the VHS-tape system on a workstation as a I/O device with read/write speed of 1.5 MB/sec. We have tested a VHS-tape system by connecting to the channel of the general purpose computer (Fujitsu M-780/10S) in our institute. We obtained a read and write speeds of 1.07 MB/sec and 1.72 MB/sec by FORTRAN test programs, respectively. Read speeds of an open reel tape and a 3480 type cassete tape by the same test programs are 1.13 MB/sec and 2.54 MB/sec, respectively. Speeds of write operation are 1.09 MB/sec and 2.54 MB/sec for the open reel and 3480 cassete tape, respectively. A start motion of the VHS-tape for read/write operations needs about 60 seconds. (author).

6956 (ANL–93/30) **Users manual for KSP data-structure-neutral codes implementing Krylov space methods.** Gropp, W. (Argonne National Lab., IL (United States)); Smith, B. Argonne National Lab., IL (United States). Aug 1994. 41p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract ONR N0001492-J1890. Order Number DE95004265. Source: OSTI; NTIS; GPO Dep.

The combination of a Krylov space method and a preconditioner is at the heart of most modern numerical codes for the iterative solution of linear systems. This document contains both a users manual and a description of the implementation for the Krylov space methods package KSP included as part of the Portable, Extensible Tools for Scientific computation package (PETSc). PETSc is a large suite of data-structure-neutral libraries for the solution of large-scale problems in scientific computation, in particular on massively parallel computers. The methods in KSP are conjugate gradient method, GMRES, BiCG-Stab, two versions of transpose-free QMR, and others. All of the methods are coded using a common, data-structure-neutral framework and are compatible with the sequential, parallel, and out-of-core solution of linear systems. The codes make no assumptions about the representation of the linear operator; implicitly defined operators (say, calculated using differencing) are fully supported. In addition, unlike all other iterative packages we are aware of, the vector operations are also data-structure neutral. Once certain vector primitives are provided, the same KSP software runs unchanged using any vector storage format. It is not restricted to a few common vector representations. The codes described are actual working codes that run on a large variety of machines including the IBM SP1, Intel DELTA, workstations, networks of workstations, the TMC CM-5, and the CRAY C90. New Krylov space methods may be easily added to the package and used immediately with any application code that has been written using KSP; no changes to the application code are needed.

6957 (ANL/MCS-TM–164) **Getting started with ADIFOR.** Bischof, C. (Argonne National Lab., IL (United States). Mathematics and Computer Science Div.); Corliss, G.; Griewank, A.; Hovland, P.; Carle, A. Argonne National Lab., IL (United States). Mathematics and Computer Science Div. Jun 1993. 38p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004143. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

ADIFOR is a source translator that, given a collection of subroutines to compute a function f, generates Fortran 77 code for computing the derivatives of this function. This paper describes step by step how to use ADIFOR to generate derivative code. It also describes common misunderstandings as well as workarounds for current shortcomings. Familiarity with UNIX™ and Fortran 77 is assumed. Also desirable is a basic understanding of automatic differentiation. ADIFOR is a research project, and thus likely to be subject to many changes. This document will change to reflect the ADIFOR changes. New users are advised to make sure that the manual version in hand is the current up-to-date one.

6958 (CIEMAT–741) **Camac Software for TJ-I and TJ-IU.** Milligen, B. P. van. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 40p. Order Number DE95722435. Source: OSTI; NTIS; INIS.

A user-friendly software package for control of CAMAC data acquisition modules for the TJ-I and TJ-IU experiments at the Association CIEMAT para Fusion has been developed. The CAMAC control software operates in Synchronization with the pre-existing VME-based data-acquisition system. The control software controls the setup of the CAMAC modules and manages the data flow from the taking to the storage of data. Data file management is performed largely automatically. Further, user software is provided for viewing and analysing the data.

6959 (CIEMAT–746) **Fitting of two and three variate polynomials from experimental data through the least squares method.** Sanchez-Miro, J.J.; Sanz-Martin, J.C. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). [1994]. 33p. (In Spanish). Order Number DE95722440. Source: OSTI; NTIS; INIS.

Obtaining polynomial fittings from observational data in two and three dimensions is an interesting and practical task. Such an arduous problem suggests the development of an automatic code. The main novelty we provide lies in the generalization of the classical least squares method in three FORTRAN 77 programs usable in any sampling problem. Furthermore, we introduce the orthogonal 2D-Legendre function in the fitting process. These FORTRAN 77 programs are equipped with the options to calculate the approximation quality standard indicators, obviously generalized to two and three dimensions (correlation nonlinear factor, confidence intervals, cuadratic mean error, and so on). The aim of this paper is to rectify the absence of fitting algorithms for more than one independent variable in mathematical libraries.

6960 (CIEMAT–749) **METEOR v1.0 : design and structure of the software package.** Palomo, E. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 71p. (In Spanish). Order Number DE95730397. Source: OSTI; NTIS.

This script describes the structure and the separated modules of the software package METEOR for the statistical analysis of meteorological data series. It contains a systematic description of the subroutines of METEOR and, also, of the required shape for input and output files. The original version of METEOR have been developed by Ph.D. Elena Palomo, CIEMAT-IER, GIMASE. It is built by linking programs and routines written in FORTRAN 77 and it adds the graphical capabilities of GNUPLOT. The shape of this toolbox was designed following the criteria of modularity, flexibility and agility criteria. All the input, output and analysis options are structured in three main menus: (i)the first is aimed to evaluate the quality of the data set; (ii) the second is aimed for pre-processing of the data; and (iii) the third is aimed towards the statistical analyses and for creating the graphical outputs. Actually the information about METEOR is constituted by three documents written in spanish: (1) METEOR v1.0: User's guide, (2) METEOR v1.0: A usage example; (3) METEOR v1.0: Design and structure of the software package. (Author)

6961 (CIEMAT–750) **METEOR v1.0 : a usage example.** Palomo, E. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 69p. (In Spanish). Order Number DE95730398. Source: OSTI; NTIS.

This script a detailed example of the use the software package METEOR for statistical analysis of meteorological data series. A real spanish meteorological data set is chosen to show the capabilities of METEOR. Output files and resultant plots provided of their interpretations are compiled in three appendixes. The original version of METEOR have been developed by Ph. D. Elena Palomo, CIEMAT-IER, GIMASE. It is built by linking programs and routines written in Fortran 77 and it adds the graphical capabilities of GNUPLOT. The shape of this toolbox was designed following the criteria of modularity, flexibility and agility criteria. 6963 (CONF-9405111–, pp. Paper 3, 1-8) **Binary authentification signatures integrity standard: System file integrity for the masses.** Bartoletti, T. (Texas A&M Univ., College Station, TX (United States)); Schales, D.; Graff, M. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Trusted software plays a central role in computer security, yet straightforward methods for authentification of installed software are lacking in the marketplace. This paper argues for a vendor-supported standard for the generation and publication of strong digital signatures for all vendor-supplied system files. Progress in the design and adoption of a proposed standard is discussed.

6964 (CONF-9405111–, pp. Paper 4, 1-8) **Security evaluation of smartcard systems.** Beuting, F.; Baumgart, R. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

RWTUEV can perform all checks both with regard to the Security and the Safety of smartcard systems. With evidence of these checks, such systems are upgraded, which promotes confidence in an acceptance of these technologies. As was shown above, these tests can be regarded as part of the development of high-quality information security.

6965 (CONF-9405111–, pp. Paper 5, 1-2) **Policies for implementing network firewalls.** Brown, C.D. (Sandia National Laboratories, Albuquerque, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Corporate networks are frequently protected by 'firewalls' or gateway systems that control access to/from other networks, e.g., the Internet, in order to reduce the network's vulnerability to hackers and other unauthorized access. Firewalls typically limit access to particular network nodes and application protocols, and they often perform special authentification and authorization functions. One of the difficult issues associated with network firewalls is determined which applications should be permitted through the firewall. For example, many networks permit the exchange of electronic mail with the outside but do not permit file access to be initiated by outside users, as this might allow outside users to access sensitive data or to surreptitiously modify data or programs (e.g., to install Trojan Horse software). However, if access through firewalls is severely restricted, legitimate network users may find it difficult or impossible to collaborate with outside users and to share data. Some of the most serious issues regarding firewalls involve setting policies for firewalls with the goal of achieving an acceptable balance between the need for greater functionality and the associated risks. Two common firewall implementation techniques, screening routers and application gateways, are discussed below, followed by some common policies implemented by network firewalls.

6966 (CONF-9405111–, pp. Paper 6, 1-12) **Lockheed testing program of the Motorola Network Encryption System (NES).** Capell, J. (Lockheed Missiles & Space Co., Inc., Sunnyvale, CA (United States)); Gentile, K.; LaPlant, G. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The requirement to provide a means for transmitting classified and unclassified data over shared public and private networks led several Lockheed companies to adopt the Motorola Network Encryption System (NES) for encryption. This device encrypts data within a datagram, leaving vital addressing information in the clear. As a result, NES encrypted data may be transmitted along with unclassified data on shared networks. In terms of performance, Motorola claims that the maximum throughput of the NES is 800 KBPS from the Ethernet port on the red side to the Ethernet port on the black side. Preliminary Local Area Network testing of the NES by Lockheed Missiles & Space Co., (LMSC) demonstrated that throughout over the LAN was somewhat slower. However, there was insufficient information available about connectivity and performance characteristics of this new COMSEC device over public networks. In order to determine whether the NES could be incorporated into existing and future networks, LMSC led a testing program with participants from Lockheed Aeronautical Systems Co. (LASC), Lockheed Sanders Co., GE Aircraft Engine Co. (GEAE), and Motorola. The goal of the testing program was to determine the connectivity and performance characteristics of the NES on public Wide Area Networks: Frame Relay, ISDN to Switched 56, and X.25. The testing program demonstrated that when connecting to a Cisco Systems network router, the NES is capable of operating over all networks tested. The performance varied by several factors: type of workstation, communications software, and packet size. Once packet size was controlled to avoid fragmentation performance was optimized. In conclusion, the NES testing program was a success.

6967 (CONF-9405111–, pp. Paper 7, 1) **FIPS 140-1, 46-2, and 185.** Carnahan, L. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Cryptography can be used to provide integrity and confidentiality for information processed and stored by automated electronic applications. Cryptography can also be used for the generation and verification of electronic signatures in these systems. For application developers who have determined a need to utilize cryptography to protect electronic information, the next step is a perplexing one. How does a developer or implementor select a cryptographic module? What requirements should be met to provide proper security features for a module implementing security? Federal Information Processing Standard (FIPS) 140-1, Security Requirements for Cryptographic Modules helps address these issues. A cryptographic module which is designed to meet FIPS

140-1 incorporates FIPS approved cryptographic algorithms and functions specified in related FIPS. FIPS approved algorithms currently include the Data Encryption Standard (DES) (FIPS 46-2) and the Escrow Encryption Standard (FIPS 185). Other related FIPS that are pointed to by FIPS 140-1 include Key Management using ANSI X9.17 (FIPS 171), the Secure Hash Standard (FIPS 180) and others. In addition, this standard specifies four security levels to provide for a wide spectrum of data sensitivity and a diversity of application environments. Each security level offers an increase in security over the preceding level. These four increasing levels of security will allow cost-effective solutions that are appropriate for different degrees of data sensitivity and different application environments. FIPS 140-1 is expected to be the foundation for NIST's current and future cryptographic standards.

6968 (CONF-9405111–, pp. Paper 8, 1-10) **Development history for procurement guidance using the trusted computer system evaluation criteria (TCSEC).** De Vilbiss, M.L. (Standards Criteria & Guidelines Division, Fort George G. Meade, MD (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

In this 10 year effort, through contracts with MITRE, through an NCSC working group, and now a National Security Agency (NSA) sponsored Procurement Guideline Working Group (PGWG), NSA has produced TCSEC Procurement Guidance, meeting the customer requirements, with Department of Defense (DoD) wide, as well as Federal Government wide, support.

6969 (CONF-9405111–, pp. Paper 9, 1-14) **Electronic resources for security related information.** Feingold, R. (Lawrence Livermore National Lab., CA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. DOE Contract W-7405-ENG-48. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The quantity, quality, and availability of electronic resources is multiplying rapidly. Information technology security professionals must make timely and effective use of these resources if they are to contain the growing threats of globally networked attackers. This paper outlines the threats including recent examples, and then provides multi-level descriptions of the abundant resources available to the information technology security community. These descriptions are valuable to everyone from a networking novice to a sophisticated expert. While the information is useful for the entire security community, this paper pays particular attention to Department of Energy requirements.

6970 (CONF-9405111–, pp. Paper 10, 1-18) **An intuitive exploration of current cryptography and recent developments and possibilities.** Feingold, R. (Lawrence Livermore National Lab., CA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. DOE Contract W-7405-ENG-48. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper is from the perspective of a computer security specialist. It emphasizes practical, contemporary cryptographic issues, and gives the reader an intuitive understanding of the topic. It is intended for management and technical people interested in computer and network security, and requires no special background or expertise. After discussing basic cryptography, the author explores recent developments such as the Federal Government's Clipper Chip (Skipjack) initiative and proposed Digital Signature Standard, and quantum cryptography. Our electronic society increasingly needs secure private communications. Current practical cryptographic technologies attempt to assure privacy by means of secret keys or one-way mathematical functions that even enormous expenditures of time and computational resources cannot invert. An attacker may compromise these methods through discovery of the secret keys, sophisticated as well as brute force cryptanalytic attacks, computationally feasible inversion of the mathematical functions, or by intercepting, altering, and then retransmitting the messages. Thus, most cryptographic applications suffer from the dilemma of either theoretical or practical limitations: 'Secret Key' systems endure the difficulties and risk of key exchange and storage, 'public key' systems lack theoretical proof of their soundness.

6971 (CONF-9405111–, pp. Paper 11, 1-6) **Challenges for DOE computer security order implementation into the 21st century.** Fulbright, J.D. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Challenges face people at every turn in life and Computer Security in the DOE nuclear weapons complex is no exception. The country has seen tremendous technological changes in how information is processed in the past 30 years, especially since the advent of the affordable personal computers in the 1980s. In fact, the computing power than used to be confined to a central computer room is now routinely provided in desktop, laptops, notebooks, and even palmtop computers. It comes as no surprises to any practicing security professional that they will face more and more challenges as the technologies emerge and they gravitate towards more distributive processing and transparent networking with the proposed information superhighways that one hears about so often. In this article, the author attempts to address the collective challenges for product evaluations, cost effectiveness, and professional certification and how one must position himself to prepare for the next century and it's projected technologies.

6972 (CONF-9405111–, pp. Paper 12, 1-12) **The Westinghouse Hanford Company Unclassified Computer Security Program.** Gurth, R.J. (Richland, WA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. DOE Contract AC06-87RL10930. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper describes the evolution of the Westinghouse Hanford Company (WHC) Unclassified Computer Security (UCS) Program over the past seven years. The intent has been to satisfy the requirements included in the DOE Order 1360.2B (DOE 1992) for Unclassified Computer Security in the most efficient and cost-effective manner.

6973 (CONF-9405111–, pp. Paper 13, 1-8) **Multilevel security guards: Controlling data flow.** Hahn, R. (Booz-Allen & Hamilton Inc., McLean, VA (United States)); Tretick, B. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy*

Computer Security Group Training Conference: Proceedings. 263p. Source: OSTI; NTIS.

Multilevel security (MLS) guards control the flow of information between two interconnected security boundaries processing data at different classification levels. They are often the initial step toward full MLS capability because they may be implemented in existing systems and can provide some of the interconnectivity required to bridge across the security boundaries of legacy systems.

6974 (CONF-9405111–, pp. Paper 14, 1-16) **A systems engineering approach to AIS accreditation.** Harris, L.M. (Los Alamos National Laboratory, NM (United States)); Hunteman, W.J. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The systems engineering model provides the vehicle for communication between the developer and the customer by presenting system facts and demonstrating the system in an organized form. The same model provides implementors with views of the system's function and capability. The authors contend that the process of obtaining accreditation for a classified Automated Information System (AIS) adheres to the typical systems engineering model. The accreditation process is modeled as a "roadmap" with the customer represented by the Designated Accrediting Authority. The "roadmap" model reduces the amount of accreditation knowledge required of an AIS developer and maximizes the effectiveness of participation in the accreditation process by making the understanding of accreditation a natural consequence of applying the model. This paper identifies ten "destinations" on the "road" to accreditation. The significance of each "destination" is explained, as are the potential consequence of its exclusion. The "roadmap" which has been applied to a range of information systems throughout the DOE community, establishes a paradigm for the certification and accreditation of classified AISs.

6975 (CONF-9405111–, pp. Paper 15, 1-8) **The network security plan – Uncharted waters.** Hawkins, R.G. (Sandia National Laboratories, Albuquerque, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The requirement to produce a network security plan for a computer network has been in place for several years but the required elements of a network plan have only now been addressed in the new draft DOE Order 5639.6A. But the new order still does not address the complexity and magnitude of information needed to characterize networks the size of which reside in the DOE laboratories. Sandia is currently formulating the design of the second version of the network security plan for its Internal Secure Network (INS). This version follows the security plan format contained in the new draft order. But to produce a network plan that is manageable, it must be modularized. How network plans are modularized is the subject of this paper.

6976 (CONF-9405111–, pp. Paper 16, 1) **Beyond systems: Total Business continuity.** Hewitt, B. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

As information systems have grown to be integral parts of organizations, companies can ill afford to be "out of business", due to their unavailability. This session will explore the dynamic arena of business continuity beyond the traditional hot-site recovery, focusing on recovery strategies and planning, evolving technologies and how to maintain a sense of security in the face of unplanned interruption.

6977 (CONF-9405111–, pp. Paper 18, 1-10) **"Security and the quality system".** Huey, G.J. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The author looks at the issue of security from the perspective of a total quality management approach. It is necessary to decide what are the threats to a system, be they human, or non-human, malicious or accidental, and then weigh the importance vs cost of protecting against these threats. The presentation points out that often the issue of security is dealt with after the product is complete, but before management feels trust in releasing it, when there are severe time and cost constraints on addressing the perceived problems.

6978 (CONF-9405111–, pp. Paper 19, 1) **Computer security issues in the reconfiguration weapons complex.** Hunteman, W. (Los Alamos National Laboratory, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The Department of Energy (DOE) is developing design specifications for new facilities to replace the aging and obsolete nuclear weapons complex. These specifications are incorporating the latest safeguards, security, environment, safety, and health requirements. The DOE has directed that the design specifications include the latest proven, state-of-the-art technologies in all areas. The advanced technologies will reduce operational costs and minimize personnel exposure to hazardous materials while providing the maximum possible safeguards and security for the nuclear material and data processed or stored in each facility. The use of state-of-the-art automated information systems and networks for data processing, security management, material accounting and control, and material processing facilities will require careful planning and design to ensure the proper protection for all data and material. The computer security design principles being used to guide the design of the computer systems and networks are discussed. The data processing systems and networks planned for each of the new facilities will be discussed and the unique computer security issues identified. The nuclear material storage facilities will support inspections by third parties (either international and/or bilateral agreements). These inspections present a special requirement to share data with the inspection teams to allow their confirmation of the inventories while ensuring the teams do not gain unauthorized access to classified data.

6979 (CONF-9405111–, pp. Paper 20, 1) **DOE independent validation and verification program.** Hunteman, W. (Los Alamos National Laboratory, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer*

Security Group Training Conference: Proceedings. 263p. Source: OSTI; NTIS.

The Department of Energy has initiated an Independent Validation and Verification (IV&V) program for automated information systems that process classified data and have a protection index of two or greater. This paper describes the overall IV&V program, its goals and objectives, the methodologies used in an IV&V, and the products produced by an IV&V. The process for determining when an IV&V is needed, how to initiate and fund an IV&V, and the expected benefits of an IV&V are presented. The first IV&V performed under this program was conducted at Los Alamos National Laboratory and the lessons learned from this initial effort are described.

6980 (CONF-9405111–, pp. Paper 21, 1) **The proliferation information network system - a computer security case study.** Hunteman, W. (Los Alamos National Laboratory, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The treaties to reduce the superpowers nuclear arsenals have resulted in a dramatic decrease in nuclear weapons and a major initiative by the Department of Energy (DOE) to address the growing concerns about proliferation of nuclear and other weapons of mass destruction. This initiative is directed towards providing the organizations responsible for controlling the export of western technologies with the ability to detect when the sale of technology may contribute to the proliferation of mass destruction weapons. DOE is developing a network of distributed databases to support the analysis of technology issues relative to nonproliferation. The distributed network and databases will be described with the computer security issues involved in the assess and sharing of the classified and sensitive data. Future plans for the network include the connection of other US Government agencies which will create additional computer security requirements to ensure the proper protection and access controls for the data.

6981 (CONF-9405111–, pp. Paper 22, 1-20) **Management issues in automated audit analysis.** Jackson, K.A. (Los Alamos National Laboratory, NM (United States)); Hochberg, J.G.; Wilhelm, S.K.; McClary, J.F.; Christoph, G.G. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. DOE Contract W-7405-ENG-36. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper discusses management issues associated with the design and implementation of an automated audit analysis system that the authors use to detect security events. It gives the viewpoint of a team directly responsible for developing and managing such a system. They use Los Alamos National Laboratory's Network Anomaly Detection and Intrusion Reporter (NADIR) as a case in point. They examine issues encountered at Los Alamos, detail their solutions to them, and where appropriate suggest general solutions. After providing an introduction to NADIR, they explore four general management issues: cost-benefit questions, privacy considerations, legal issues, and system integrity. Their experiences are of general interest both to security professionals and to anyone who may wish to implement a similar system. While NADIR investigates security events, the methods used and the management issues are potentially applicable to a broad range of complex systems. These include those used to audit credit card transactions, medical care payments, and procurement systems.

6982 (CONF-9405111–, pp. Paper 23, 1-4) **Privacy issues for electronic mail.** Jennings, B. (Sandia National Laboratories, Albuquerque, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Electronic mail has become an essential tool for conducting business and research in modern American corporations. Unfortunately, the use of this tool and other similar tools of electronic commerce has outstripped the ability to deal with privacy issues and corporate policies for E-mail use. Although the technology has been developed for privacy-enhanced E-mail, it is not yet in wide use. Similarly, even privacy enhanced technology does not provide total protection from a knowledgeable network manager. The increased use of electronic mail and other network technology has ignited concerns for privacy issues from a legal sense. The author will discuss a recent bill introduced to congress, the current Electronic Communication Privacy Act, and standard practice by employers in industry.

6983 (CONF-9405111–, pp. Paper 24, 1) **MVS system vulnerabilities: identification.** Jourde, Juan Carlos. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Does MVS security software provide effective protection for MVS systems? This session will provide a basic understanding of how system penetration can be accomplished from a general "nonprivileged" user. Many organizations rely upon the fact that they are audited, have an access control package, token ID cards, "proper" procedures and technical implementations, etc. Unfortunately those who target your systems do not care if certain controls are in place. These people will avoid controls and search for vulnerabilities in the implementation of the security envelope. Examples of major MVS security sensitive areas will be covered. The analysis includes MVS technical topics, "Social Engineering" threats, physical assess vulnerabilities, and other issues related to MVS systems security.

6984 (CONF-9405111–, pp. Paper 25, 1) **Private branch exchange (PBX) security guideline.** Kuhn, D.R. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Basic telephone switch system technology and security capabilities will be discussed. Threats and vulnerabilities of private branch exchange systems will be detailed based on the National Institute of Standards and Technology studies. An example security policy and baseline security controls will be presented along with a security assessment checklist.

6985 (CONF-9405111–, pp. Paper 26, 1) **Threat IV.** LaBarre, V. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The Director of Central intelligence is revising the "Threat to Automated Information Systems and Networks" document, otherwise

known as Threat III. While the new document, Threat IV, will concentrate on threats, it will discuss known vulnerabilities and incidents. Threat IV will also show the application of the threat-evaluation methodology developed in Threat III to several real-world problem areas. Threat IV is in the final review stage and is expected to be Promulgated by mid-1994, This presentation will give an overview of the contents of Threat IV and will discuss the application of the document's conclusions to the DOE community.

6986 (CONF-9405111–, pp. Paper 27, 1-10) **An overview of the Secure Network Server.** Leaman, J.R. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper will provide an overview of the Secure Network Server (SNS) program. It will discuss the history of SNS, the current state of this program, and the future direction and application of this technology. In the short term, SNS will provide the capability to securely interconnect networks of differing classification levels. In the future, the SNS will act as a secure Network File System (NFS) file server providing secure storage and separation for information with different classifications. This paper also describes the current SNS protocol suite as well as the migration to other communication protocols in support of future technological advances.

6987 (CONF-9405111–, pp. Paper 28, 1-6) **The DOE training resources and data exchange (TRADE) – a network of sharing.** Manning, D. (Oak Ridge Institute for Science and Education, TN (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The Training Resources and Data Exchange (TRADE) is a network that encourages and facilitates the exchange of ideas, techniques, and materials; and serves as a forum for the discussion of issues of interest to the DOE community. TRADE was established in 1978 when one DOE sponsor and 200 persons joined forces to create a network for improving training and development across DOE. Today there are 10 DOE sponsors and more than 5000 TRADE members located at most of the DOE sites and offices. The Oak Ridge Institute for Training and Development (ORISE), managed by the Oak Ridge Associated Universities, operates the TRADE network for the Department of Energy. An Executive Committee plans general TRADE activities and DOE advisors represent the program offices which support TRADE. All management and administrative activities are performed by ORISE staff.

6988 (CONF-9405111–, pp. Paper 29, 1) **Security information and resources on the Internet.** Mayson, W.; Cochrane, A. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This session will present a short overview of some of the public domain security and utility software available on the Internet. Information about the type of software available, locations to start looking for the software, and tools to aid in the search for this software will be presented. Also, an overview of books that provide more information will be presented. These books include those available from a bookstore as well as books available on the Internet itself. Software to be discussed is available for VMS, Unix, Macintosh, PC compatibles, and other platforms.

6989 (CONF-9405111–, pp. Paper 30, 1-6) **Applications of an NSA-Endorsed Type 1, data storage encryptor.** Meyers, R.V. (HRB Systems, State College, PA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Encryption is a well known and respected means of protecting all types of data in a variety of environments. Data storage is a new application of totally secure encryption. In this type of application any data that may be represented digitally may be encrypted and stored on any commonly available medium such as CD-ROM, tape, or disk. The SSP3110 Data Storage Encryptor is endorsed by the National Security Agency (NSA) at a "Type 1" device. This designation certifies it for use by the U.S. Government, and its appropriately cleared contractors, with any level of classified data. Once the data has been encrypted and recorded on the target medium, that medium may now be stored, shipped, and handled as UNCLASSIFIED. After a very brief explanation of the development and operation of the device, the author presents some examples of how users are taking advantage of these benefits.

6990 (CONF-9405111–, pp. Paper 31, 1) **Your role in interviews, interrogations, and investigations.** Mick, S. (Lawrence Livermore National Laboratory, CA (United States)); Robinson, G. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

As a computer security professional, you may be called on to assist site security or law enforcement personnel in the investigation of incidents, infractions, malicious activity or crimes involving DOE computer systems. This may involve interviewing or interrogating victims, witnesses, and suspects. You may also be required to conduct an investigation to locate evidence of misconduct or criminal activity in computer systems. This paper reviews the type of information you will want to request or search for in interviews or investigations.

6991 (CONF-9405111–, pp. Paper 32, 1-4) **Classified computer configuration control system (C^4S) revision 3.** O'Callaghan, P.B.; Nelson, R.A.; Grambihler, A.J. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The U.S. Department of Energy (DOE) computer security program in the past, present, and future has and will require computer security managers to keep detailed records of hardware and software used in classified processing. The information is constantly changing and must be updated. The information also needs to be easily accessible. Much of the information is similar in nature with variations in detail. All of these qualities led to the conclusion that the information needed to support management of classified computers is best stored in a computer database system. At the Hanford Site such a system has been in varying degrees of use and development since 1985. The C^4S had its beginning when it

started as a dBase III Plus system that was created by the Westinghouse Hanford Company (WHC) "Classified Automated Information System (AIS) Security Manager" to track classified computers being operated by WHC. Other contractors at the Hanford Site wanted to use it to aid in the administration of their systems. As such, an effort was begun to develop a more universal system. Revision 2 resulted in a more complex database and an application that worked with mouse control. Though Revision 2 was an improvement, the users wanted a database system that was more accessible with standard database management systems to do ad hoc information assessment and reporting. Efforts were then turned to developing Revision 3 that would have all the qualities of the previous developments but use Borland PARADOX tables.

6992 (CONF-9405111–, pp. Paper 33, 1-4) **NID - The network intrusion detector.** Palasek, R. (Lawrence Livermore National Laboratory, CA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The Network Intrusion Detector, NID, is a package of software tools whose signature detection component has been found to be effective in recognizing network based intrusions. It is used most often in retrospective mode, but it can and has been used in near real time or on-line mode. Different components perform traffic capture, filtering, examination and signature detection, reporting, and detailed analysis.

6993 (CONF-9405111–, pp. Paper 34, 1-14) **Issues in migrating from single-level to multi-level secure (MLS) databases.** Payne, P.W. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The move from single-level to multi-level secure (MLS) databases presents new issues in database design and implementation, some of which are not trivial. This paper addresses problems and options in moving from single-level to multi-level secure databases. Some of the issues discussed are; level of classification; polyinstantiation and cover stories; data integrity versus data security; aggregation; auditing; options for implementation of MLS Relational Data Base Management System (RDBMS) software; impacts on applications; and migration. In discussing options for MLS database design and implementation, three commercial MLS RDBMS products are considered: Oracle, Sybase, and Informix.

6994 (CONF-9405111–, pp. Paper 35, 1-6) **Security's role in technology transfer.** Pearson, L.A. (Lawrence Livermore National Lab., CA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

In April 1992, the Safeguards and Security Department Manager recognized that the Lawrence Livermore National Laboratory (LLNL) extended mission of collaborating with private industry would bring extended responsibilities to employees. LLNL employees understood their responsibilities for protecting classified and sensitive unclassified information, but protecting private industry's proprietary information was something different. With this issue in mind, the Department Manager assigned the Information and Security Awareness Group with the task of developing a Security Awareness Program that would inform and educate LLNL personnel on safeguarding proprietary/business protected information. The initial response to the program has been positive. LLNL employees are enthusiastic and eager for established guidelines. LLNL is the first laboratory to development a formal education program involving safeguarding proprietary information and several other DOE contractors have requested information and copies of their procedures. Potential partners have asked for copies of the procedures, expressing an interest in how LLNL will protect their proprietary information - confirming the importance of developing guidelines and procedures.

6995 (CONF-9405111–, pp. Paper 36, 1) **Secure, high-speed ATM networking for consolidation of Sandia's supercomputing site.** Pierson, L. (Sandia National Laboratories, Albuquerque, NM (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Sandia National Laboratories consolidated its secure supercomputing centers in California and New Mexico into a single site in New Mexico, while providing acceptable remote supercomputing service to researchers at Livermore. The initial multi-data-level security requirements and the Wide Area Network (WAN) performance requirements which must be satisfied to continue to provide acceptable remote supercomputing service were established early in this supercomputer consolidation project. An SMDS/ATM/DS3 intersite communication design as implemented to satisfy these requirements. This design incorporates the use of Broadband Integrated Services Data Network (BISDN) technology. The design utilizes Switched Multi-megabit Data Service (SMDS) access to Asynchronous Transfer Mode (ATM) Switchgear, and DS3 (45 Mb/s) encrypted intersite trunks. These DS3 links will later be replaced with Synchronous Optical Network (SONET) links. This communication design, intended to achieve secure, low delay, low error rate, high throughput, high availability Wide Area Networking for remote supercomputing and remote visualization of supercomputer output, has been evaluated in an extensive testbed. Initial testing has shown that this design achieves its performance and security goals and will be extensible to achieve the higher performance required over time. This paper will present an overview of how this ATM communication design satisfies both the performance requirements and the mandatory and discretionary controls required to process multiple data classification levels within a Q-cleared community of users.

6996 (CONF-9405111–, pp. Paper 37, 1-6) **Using trusted databases for unclassified purposes.** Rome, J.A. (Oak Ridge National Lab., TN (United States)); Baylor, L.R.; Payne, P.W. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The advantages of using secure databases on workstations with secure operating systems are discussed. An international fusion energy database is being used as a test bed for these ideas. Among the problems to be solved are connections across Internet at different security levels, and user-friendliness.

6997 (CONF-9405111–, pp. Paper 38, 1-7) **What do people really need to know about computer security incidents?.** Schultz, E.E. (Arca Systems, Inc., San Jose, CA (United States)); Christensen, M.; Ferro, P.H.; Jennings, T.E.; Teal, D.M. USDOE Assistant Secretary for Human Resources and Administration,

Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

What do people who respond to computer security incidents really need to know about the incidents they investigate? Although different agencies have different formal requirements for incident reporting, certain information may be essential for determining the technical and procedural aspects of incident response. The authors conducted a study to obtain an empirical answer to the issue in question. Personnel with experience on computer emergency response teams (CERTs) were interviewed as part of a study designed to obtain answers to this issue. Personnel were asked what information they need when an intrusion (either remotely or locally) occurs. Analysis indicates that there are seven major categories of required data about intrusions. Many of these categories include many specific information details (described in the paper); some details (e.g., the time the attack was first noticed) could be subsumed by more than one category. In general, interviewed personnel reported that they would rather have too much information rather than too little, and that ability to quickly assess a particular subset of the data was especially critical. Results suggest ways to increase the efficiency of incident responding and incident reporting.

6998 (CONF-9405111–, pp. Paper 39, 1) **Status report on CIAC.** Sparks, S. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Computer Incident Advisory Capability (CIAC) activities since the last conference will be discussed, including information on the following: (1) today's incident profile; (2) where most of today's threats have come from; (3) new threats on the horizon; (4) new hacking tools and techniques; (5) available tools and resources; (6) CIAC's electronic communications mechanisms; (7) CIAC and other incident response teams; (8) other services such as workshops, white-hat audits, etc.

6999 (CONF-9405111–, pp. Paper 40, 1-22) **Product considerations in secure development: Lessons learned from the development of trusted Solaris.** Sullivan, G. (Sun Microsystems Federal, Inc., Mountain View, CA (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The development process for Sun Microsystems' Solaris® CMW 1.0 operating system (now called Trusted Solaris®) has yielded some very valuable lessons learned about how to turn a trusted development into a commercially-available product. This paper will focus on the lessons about product issues that were learned during the development of Solaris (CMW) (Compartmented Mode Workstation). Special consideration will be given to networking and interoperability, maintaining the Sun Look and Feel, applications support, product support and training, and version maintenance of the trusted operating system so that it supports currently shipping hardware and software.

7000 (CONF-9405111–, pp. Paper 41, 1-4) **Business continuity planning.** Taylor, B. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Texas Instruments (TI) is a global manufacturing corporation with 41 manufacturing sites in 18 countries. Manufacturing operations, distribution center operations, and sales and marketing business functions are carried out globally. An extensive worldwide computer and communications network are in place to support this global business. Communications circuits ranging from 9.6 kbps to TI links are required to provide high bandwidth integrate voice and data communications. This global communication network is managed at a command center in Plano, Texas. By 1987, TI deployed 36 mainframe computer centers. These were located at most major business locations. Through constant review and evaluation of TI's information services, a better and more cost effective means for providing computer systems support was undertaken in 1989. A global computer center consolidation effort was implemented. This effort would, in five years, result in the consolidation of 36 computer centers into 3. The total savings to TI was $23 million dollars per year. Upon approval of the computer center consolidation program, the establishment of a viable disaster recovery capability was also directed. A five-year business recovery services contract was signed with IBM in May 1991. Computer center service availability, from the business functions point of view, became very important. Every hour of every day became prime time for one's computer systems. An acknowledged benefit from the total consolidation program was that performance levels increased even though more and more processing was being accomplished on fewer processors.

7001 (CONF-9405111–, pp. Paper 42, 1-6) **Privacy enhanced mail (PEM) experiences with CMW and MLS systems.** Tolliver, J.S. (Oak Ridge National Laboratory, TN (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Most current CMW and MLS systems provide a multilevel secure mail tool. The tools provided generally use SMTP for mail over TCP/IP and some sort of local mail transport for mail to other users on the local system. While the local mailer and SMTP mail can be multilevel secure (i.e., with MAC labels preserved), the tools do not provide the privacy enhancements of integrity or confidentiality of the received message, nor do they provide for non-repudiation by the sender. For local mail, the TCB generally provides confidentiality and perhaps non-repudiation, but does not explicitly address integrity in the sense of digital signatures. Some vendors claim to have hooks in their mail software to implement privacy enhancements once some privacy enhancement scheme becomes standard, but none has yet integrated privacy enhancements with MLS functionality. Within the single-level or non-trusted arena, the Privacy Enhanced Mail protocol (PEM) provides integrity, confidentiality, and non-repudiation services over SMTP networks, but does not address MLS issues. As a first step in attempting to understand the issues involved in combining privacy enhancements and MLS functionality, the author explores using Trusted Information Systems' TIS/PEM on CMW and MLS platforms. Since the hooks in the vendor's mail tool user agents are not available, he is forced to use some other user agent. The TIS/PEM package conveniently includes a modified MH (Rand Mail Handler) package that integrates PEM into the standard MH suite of tools.

7002 (CONF-9405111–, pp. Paper 43, 1-6) **Enhancing the Trust Technology Assessment Program (TTAP).** Toth, P.; Fiahavin, E. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC

(United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper provides a history and an amendment to the proposed program for the evaluation of trusted information technology products. A great deal of research is needed in this area to determine if reliance on the development process is an adequate means of gaining assurance. NIST and NSA are committed to exploring this new area of assurance and continuing to develop the Trust Technology Assessment Program. NIST and NSA are dedicated to increasing the number of security products available to the civil and private sectors.

7003 (CONF-9405111–, pp. Paper 44, 1-4) **New developments in national and international security criteria.** Troy, E.F. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This presentation will provide current information on the progress of U.S. and international work to achieve a "Common Information Technology Security Criteria" (CC). The CC Project is intended to replace the Information Technology (IT) security criteria in North America and the European Union with a single criteria for the development and evaluation of secure IT products and systems. The older criteria to be superseded include the U.S. Trusted Computer System Evaluation Criteria (the "Orange Book") and its successor, the draft Federal Criteria for IT Security (FC), along with the Canadian Trusted Computer Product Evaluation Criteria (CTCPEC), the European Information Technology Security Evaluation Criteria (ITSEC), and the draft International Standards Organization (ISO) security criteria. In June 1993, the governments of North America and the Commission for the European Communities (CEC) announced that they agreed to form a joint project to develop the CC in lieu of furthering any work on regional or national criteria. Participants include the European Union (EU, formerly the European Community), Canada, and the United States.

7004 (CONF-9405111–, pp. Paper 45, 1) **The changing nature of computer security threats.** Van Lehn, A. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper is on recent trends in computer security threats, based on the experiences of the U.S. Department of Energy's incident response team: CIAC. The conference presentation will report the very latest information for those whose job responsibility includes incident handling, computer security training and awareness, or who share an interest because they are users of computers and networked systems. Security personnel are seeing an increase in problems partly because the use of computers is increasing, but mostly because networking to world-wide electronic resources is rapidly increasing. Other factors involve present economic, political, and social conditions. Noted also is a non-trend-a trend which is needed but doesn't seem to be happening. Department of Energy sites are encountering an alarming increase in the number of new viruses. The trend is toward more sophistication and maliciousness (e.g., polymorphism, stealth, data scrambling, and disk drive burnout). The industry has seen the Virus Creation Laboratory (VCL) which makes the production of a new virus a simple menu selection process. Virus writers appear to be waging guerrilla warfare against those that "have the latest and best" computers. They see this new form of electronic sabotage as a way of leveling the computational playing field to overcome their perceived economic disadvantage.

7005 (CONF-9405111–, pp. Paper 46, 1) **The security evaluations approach to computer security: An update.** Wade, J.R. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

The DOE Deputy Assistant Secretary for Security Evaluations (EH-4) has been assigned the responsibility for establishing and implementing an independent inspection and assessment program to determine the effectiveness of DOE's safeguards and security policies and procedures, including their implementation. Computer security, for both classified and unclassified computer systems and networks, is one topic included in the Security Evaluations (SE) program. This presentation will provide an update of SE's approach to computer security, including inspection methodology, performance testing, and lessons learned.

7006 (CONF-9405111–, pp. Paper 47, 1-4) **How effective is your computer security awareness training?.** Walsh, T. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Because computer security training is mandatory, employee attitude affects what they will get out of the training. To ensure students are getting the most out of your training, you have got to gather quality measurements on the effectiveness of your program. What are some ways to measuring the effectiveness of the training? Four ways to measure the effectiveness of training are: (1) critiques, (2) skills check, (3) application of the training information, and (4) measurable results.

7007 (CONF-9405111–, pp. Paper 49, 1-8) **Security penetration approach.** Weiss, H. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

In order to perform a security penetration analysis of a system, several steps must be carried out by a small team of experts to ensure that the analysis will be carried out in a precise and forthright manner. This paper provides a high-level glimpse at an approach to performing a security penetration analysis.

7008 (CONF-9405111–, pp. Paper 50, 1) **Usefulness of a network reference monitor.** Williams, T. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This paper will discuss the usefulness of a datagram level network reference monitor (NRM) that supports Mandatory Access

Controls (MAC), Discretionary Access Control (DAC), Identification and Authentication (I&A), and Audit. It is based on the GKI VSLAN which is a B2 level network component that enforces a security policy at the data link layer of the OS1 protocol tack. Example architectures using non-evaluated and a variety of evaluated hosts shall be shown, and a discussion of the usefulness of the NRM in the architectures will be provided.

7009 (CONF-9405111–, pp. Paper 51, 1-12) **Multilevel information system security initiative.** Woodie, P. (Information Systems Security Organization, Meade, MD (United States)). USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Communications managers today face the conflicting pressures of increased network communications requirements and yet reduced communications budgets, while maintaining or increasing security in their networks. This is leading to the increased use of public networks, where network managers have little or no control over the security of these common-access network backbones. In addition, there is a long term goal to extend security back to the actual end users. These two factors lead to a concept called "writer-to-reader" security. In this approach to security, an e-mail message, for example, is protected from the time of origination at the end user's terminal ("writer"), where security services are applied, until the time of reading at the recipient terminal ("reader"). This is the fundamental percept of the Multi-level Information System Security Initiative (MISSI). This paper explains some of the motivations for this approach to security and how it is implemented in a family of compatible network security products. Included is an explanation of each component, and how it interacts with the other products to provide a balanced and graded approach to distributed network security. The paper then describes how these products will be combined into a series of phased releases that will provide both increasing security functionality and security assurance/trust.

7010 (CONF-9405111–, pp. Paper 1, 1) **Steve Jackson Games, communications, privacy, and auditing.** Bailey, D.; Smith, F.; Snyder, J. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

This talk will discuss enforcement of computer crime laws, the Electronic Communications Privacy Act (ECPA), and auditing using the Steve Jackson Games case as a vehicle. Steve Jackson Games of Austin, TX was the subject of a computer seizure in a complex case involving the theft of an electronic document from Bell South of Atlantic, GA. The computers were seized and held for over 2 years even though no one at Steve Jackson Games was ever accused of a crime, and no one one was ever charged. The self-destruction of the Government's case provides insights into the preparation of a case for prosecution (from the point-of-view of the victim), the content of the ECPA, and the privacy of electronic mail. The lessons from this case will also be applied to the problem of collecting and maintaining audit trails.

7011 (CONF-9405111–, pp. Paper 2, 1) **General IV&V operations.** Baker, L. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

An independent Verification and Validation (IV&V) exercise is intended to assist the Designated Accrediting Authority (DAA), the System Designers, and System implementors. The IV&V provides an unbiased outside view of the security design and implementation of a secure system (or network). The IV&V process assists the DAA by providing a technical view of the system from the policy and accreditation perspective. The IV&V process helps the System Designers and System implementors by providing an independent view from people who understand the technical and security aspects of the system.

7012 (CONF-9405111–, pp. Paper 17, 1) **Recovery strategies and planning.** Hewitt, B. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

As information systems have grown to be integral parts of present organizations, these organizations can ill afford to be "out of business", due to their unavailability. This session will explore the dynamic arena of business continuity beyond the traditional hot-site recovery, focusing on recovery strategies and planning, evolving technologies, and how to maintain a sense of security in the face of unplanned interruption.

7013 (CONF-9405111–, pp. Paper 48, 1-2) **Don't copy that floppy.** Wasch, K. USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Office of Information Resources Management Policy, Plans, and Oversight; USDOE Office of Intelligence and National Security, Washington, DC (United States). Office of Safeguards and Security. [1994]. From 16. Department of Energy computer security group training conference; Denver, CO (United States); 3-5 May 1994. In *16th Department of Energy Computer Security Group Training Conference: Proceedings.* 263p. Source: OSTI; NTIS.

Software piracy, the unauthorized duplication of copyrighted software, accounted for a 2.4 billion dollar loss to the software industry in 1990. Software piracy is not only a problem at the corporate level but in commercial businesses, educational, and non-profit institutions as well. Introduced are the three areas of SPA's Anti-Piracy activities: Litigation, Legislation, and Education. Examples of past law suits, audits, and other investigations are discussed; the legislation that provides a framework for their legal activities is referenced; and examples of public relations campaigns, aimed at informing the end-user of the consequences of software piracy are shared.

7014 (DOE/ER–0632) **ESnet Program Plan 1994.** Merola, S. USDOE Office of Energy Research, Washington, DC (United States). Office of Scientific Computing. 1 Nov 1994. 136p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005329. Source: OSTI; NTIS; INIS; GPO Dep.

This Program Plan characterizes ESnet with respect to the current and future needs of Energy Research programs for network infrastructure, services, and development. In doing so, this document articulates the vision and recommendations of the ESnet Steering Committee regarding ESnet's development and its support of computer networking facilities and associated user services. To afford the reader a perspective from which to evaluate the ever-increasing utility of networking to the Energy Research community, we have also provided a historical overview of Energy Research networking. Networking has become an integral part of the work of DOE principal investigators, and this document is intended to assist the Office of Scientific Computing in ESnet program planning and management, including prioritization and funding. In particular, we identify the new directions that ESnet's development and implementation will take over the course of the next several years. Our basic goal is to ensure that the networking requirements of the respective scientific programs within Energy Research are addressed

fairly. The proliferation of regional networks and additional network-related initiatives by other Federal agencies is changing the process by which we plan our own efforts to serve the DOE community. ESnet provides the Energy Research community with access to many other peer-level networks and to a multitude of other interconnected network facilities. ESnet's connectivity and relationship to these other networks and facilities are also described in this document. Major Office of Energy Research programs are managed and coordinated by the Office of Basic Energy Sciences, the Office of High Energy and Nuclear Physics, the Office of Magnetic Fusion Energy, the Office of Scientific Computing, and the Office of Health and Environmental Research. Summaries of these programs are presented, along with their functional and technical requirements for wide-area networking.

7015 (ESTSC–000138CY00101) **DYNA3D. Explicit 3-d Hydrodynamic FEM Program.** Whirley, R.G. (Lawrence Livermore National Lab., CA (United States)); Englemann, B.E. Lawrence Livermore National Lab., CA (United States). 30 Nov 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: CRAY1; UNIX; FORTRAN; 1 QIC Cartridge. Compiles on both the Cray1 and Cray X-MP computers.

DYNA3D is an explicit, three-dimensional, finite element program for analyzing the large deformation dynamic response of inelastic solids and structures. DYNA3D contains 30 material models and 10 equations of state (EOS) to cover a wide range of material behavior. The material models implemented are: elastic, orthotropic elastic, kinematic/isotropic plasticity, thermoelastoplastic, soil and crushable foam, linear viscoelastic, Blatz-Ko rubber, high explosive burn, hydrodynamic without deviatoric stresses, elastoplastic hydrodynamic, temperature-dependent elastoplastic, isotropic elastoplastic, isotropic elastoplastic with failure, soil and crushable foam with failure, Johnson/Cook plasticity model, pseudo TENSOR geological model, elastoplastic with fracture, power law isotropic plasticity, strain rate dependent plasticity, rigid, thermal orthotropic, composite damage model, thermal orthotropic with 12 curves, piecewise linear isotropic plasticity, inviscid two invariant geologic cap, orthotropic crushable model, Moonsy-Rivlin rubber, resultant plasticity, closed form update shell plasticity, and Frazer-Nash rubber model. The hydrodynamic material models determine only the deviatoric stresses. Pressure is determined by one of 10 equations of state including linear polynomial, JWL high explosive, Sack Tuesday high explosive, Gruneisen, ratio of polynomials, linear polynomial with energy deposition, ignition and growth of reaction in HE, tabulated compaction, tabulated, and TENSOR pore collapse. DYNA3D generates three binary output databases. One contains information for complete states at infrequent intervals; 50 to 100 states is typical. The second contains information for a subset of nodes and elements at frequent intervals; 1,000 to 10,000 states is typical. The last contains interface data for contact surfaces.

7016 (ESTSC–000142IBMPC04) **RESRAD5.43. Site-Specific Residual Radioactivity.** Yu, C. (Argonne National Lab., IL (United States)). Lawrence Livermore National Lab., CA (United States). 1 Sep 1992. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: IBM PC; MS-DOS 3.1; Lahey F77L 3.01 (78%) and Microsoft QuickBASIC 4.5 (22%); 1 3.5 Diskette. Package does not have Source Code.

RESRAD5.43 is a computer code developed at Argonne National Laboratory (ANL) for the U.S. Department of Energy (DOE) to calculate site-specific residual radiation material guidelines and radiation dose/risk to an on-site individual (worker or resident) at a radioactively contaminated site. The RESRAD code has been adopted by the DOE in Order 5400.5 for the derivation of soil cleanup criteria and dose calculations, and it has been used widely by DOE, other federal agencies, and their contractors. The original models used by ANL to develop RESRAD were initially developed as part of a DOE effort that began in the early 1980s and involved most of the national laboratories and DOE program offices. The RESRAD code is continuously improved and updated to incorporate comments from users and new features that ease the interaction with users and increase the code's capability and flexibility. The DOE Offices of Environmental Guidance and Environmental Restoration also provide periodic guidance regarding any significant changes to the code.

7017 (ESTSC–000219I600001) **TOUGH2. Unsaturated Groundwater and Heat Transport Model.** Pruess, K. (Lawrence Berkeley National Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). 1 Jul 1991. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Source: ESTSC.

Description: IBM RS 6000; Operating System-Independent (Re-FORTRAN 77; 1 3.5 Diskette. Source Code upgraded to make possible the efficient simulation of large three-dimensional problems on the scale of 10,00 grid blocks. The conjugate gradient module requires no additional user input, with the exception of one single parameter for choosing which of the different solvers will be used.

TOUGH2 is a new and improved version of TOUGH. TOUGH2 offers added capabilities and user features, including the flexibility to handle different fluid mixtures (water, water with tracer; water, CO2; water, air; water, air, with vapor pressure lowering and water, hydrogen), facilities for processing of geometric data (computational grids), and an internal version control system to ensure referenceability of code applications. TOUGH2 is a multi-dimensional numerical model for simulating the coupled transport of water, vapor, air, and heat in porous and fractured media. The program provides options for specifying injection or withdrawal of heat and fluids. Although primarily designed for studies of high-level nuclear waste isolation in partially saturated geological media, it should also be useful for a wider range of problems in heat and moisture transfer, and in the drying of porous materials. For example, geothermal reservoir simulation problems can be handled simply by setting the air mass function equal to zero on input. The TOUGH2 simulator was developed for problems involving strongly heat-driven flow. To describe these phenomena a multi-phase approach to fluid and heat flow is used, which fully accounts for the movement of gaseous and liquid phases, their transport of latent and sensible heat, and phase transitions between liquid and vapor. TOUGH2 takes account of fluid flow in both liquid and gaseous phases occurring under pressure, viscous, and gravity forces according to Darcy's law. Interference between the phases is represented by means of relative permeability functions. The code handles binary, but not Knudsen, diffusion in the gas phase and capillary and phase adsorption effects for the liquid phase. Heat transport occurs by means of conduction with thermal conductivity dependent on water saturation, convection, and binary diffusion, which includes both sensible and latent heat.

7019 (ESTSC–000228CY00100) **INGRID. 3-D Mesh Generation Nonlinear Systems.** Christon, M.A. (Lawrence Livermore National Lab., CA (United States)); Dovey, D.; Stillman, D.W.; Hallquist, J.O.; Rainsberger, R.B. Lawrence Livermore National Lab., CA (United States). 1 Sep 1992. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: CRAY1; UNIX; FORTRAN; 1 Cartridge.

INGRID is a general-purpose, three-dimensional mesh generator developed for use with finite element, nonlinear, structural dynamics codes. INGRID generates the large and complex input data files for DYNA3D, NIKE3D, FACET, and TOPAZ3D. One of the greatest advantages of INGRID is that virtually any shape can be described without resorting to wedge elements, tetrahedrons, triangular elements or highly distorted quadrilateral or hexahedral elements. Other capabilities available are in the areas of geometry and graphics. Exact surface equations and surface intersections considerably improve the ability to deal with accurate models, and a hidden line graphics algorithm is included which is efficient on the most complicated meshes. The primary new capability is associated with the boundary conditions, loads, and material properties required by nonlinear mechanics programs. Commands have been designed for each case to minimize user effort. This is particularly important since special processing is almost always required for each load or boundary condition.

7020 (ESTSC–000273CY00101) **TAURUS. 3-d Finite Element Code Postprocessor.** Whirley, R.G. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 May 1991. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: CRAY1; UNIX; FORTRAN; 1 Mag Tape.

TAURUS reads the binary plot files generated by the LLNL three-dimensional finite element analysis codes, NIKE3D (ESTSC 139), DYNA3D (ESTSC 138), TACO3D (ESTSC 287), TOPAZ3D (ESTSC 231), and GEMINI (ESTSC 455) and plots contours, time histories,and deformed shapes. Contours of a large number of quantities may be plotted on meshes consisting of plate, shell, and solid type elements. TAURUS can compute a variety of strain measures, reaction forces along constrained boundaries, and momentum. TAURUS has three phases: initialization, geometry display with contouring, and time history processing.

7021 (ESTSC–000653I309000) **OMP. Occupational Medical Program.** Galloway, D. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Bode, M.; Batt, D.; Bills, R. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). 25 Oct 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: ESTSC.

Description: IBM3090; MVS in a TSO/ISPF environment usI-CASE, COBOL II and C; 8 3.5 Diskettes. Proprietary software (Information Engineering Facility) is required to generate and maintain the software.

The Occupational Medical Program (OMP) oversees all Idaho National Engineering Laboratory (INEL) health care, and provides services to all managing and operating (M&O) contractors at the INEL and for the Department of Energy Idaho Office (DOE-ID). The evolution of the automated OMP at the INEL is guided by the U.S. Department of Energy (DOE) directives and regulations. The OMP is developing a multiyear plan for the computerization of patient and demographics, epidemiology, medical records, and surveillance. This plan will require the following six development phases: Employee Demographic Phase, Patient Surveillance Certification and Restrictions Phase, Electronic Notification Phase, Epidemiology-Industrial Hygiene/Radiation Exposure/OMP Integration Phase, Medical Scheduling Phase, and Medical Records Phase.

7022 (ESTSC–000704D0VAX00) **TRAMP. Transport of Metallic Fission Products Along Multiple Parallel Paths.** Hudritsch, W. (CEGA Corporation, San Diego, CA (United States)); Richards, M. General Atomics, San Diego, CA (United States). 1 Nov 1991. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-90CH10438. Source: ESTSC.

Description: DEC VAX; VMS; FORTRAN; 1 Mag Tape. Package compiled without error. Linkage failed undefined symbols (FORID, MERR, TICKER).

TRAMP is used to calculate the transport of metallic fission products along multiple parallel paths; the primary application is transport in and release from nuclear-grade graphite. The transport mechanisms are concentration-driven diffusion, thermal diffusion, and convection.

7023 (ESTSC–000713IBMPC00) **SAMPSIZE/TIDSIZE. Computes Sample Sizes Based on the Hypergeometric Distribution.** Bieber, A.M. Jr (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). 1 Sep 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Source: ESTSC.

Description: IBM PC; MS-DOS or PC-DOS version 3.1 or Microsoft C, version 7.0; 1 3.5 Diskette. If printed output is desired, it is directed to device PRN. If a serial printer is used, the DOS MODE command should be usedd to redirect printed output to the appropriate serial port.

SAMPSIZE computes the number of items required in a random sample without replacement from a population of known size in order to achieve 95% confidence that no more than 1% of the population possesses a given property (typically, some sort of defect). TIDSIZE performs the same computations for a 5% defect rate. The programs may be used to compute sample sizes necessary for performance testing of nuclear materials accounting and tamper-indicating device systems as specified in DOE office of Safeguards and Security Detection Element Evaluation Approaches.

7024 (ESTSC–000716IBMPC01) **NEAT1,2,3. National Energy Audit.** Gettings, M. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 1 Jul 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; DOS; C; 1 3.5 Diskette. NEAT uses printer commands already existing on the computer to print results. No reconfiguration of the printer is necessary. Output files produced by the program are in a format readable by any word processor or text editor and can be viewed in DOS. This version is for DOE regions 1,2 and 3 which include the following states: Connecticut (CT), Delaware (DE), Maine (ME), Maryland (MD), Massachusetts (MA), New Hampshire (NH), New Jersey (NJ), New York (NY), Pennsylvania (PA), Rhode Island (RI), Vermont (VT), Virginia (VA), Washington D.C. (DC), and West Virginia (WV).

The National Energy AudiT (NEAT) software package is the Department of Energy's (DOE) new energy auditing tool. NEAT is a program for personal computers that was designed for use by local agencies in the Weatherization Assistance Program. It is an approved alternative audit that meets all auditing requirements set forth by the program as well as those anticipated from new regulations pertaining to waiver of the 40 percent materials requirement.

7025 (ESTSC–000716IBMPC02) **NEAT4. National Energy Audit.** Gettings, M. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 1 Jul 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; DOS; C; 1 3.5 Diskette. NEAT uses printer commands already existing on the computer to print results. No reconfiguration of the printer is necessary. Output files produced by the program are in a format readable by any word processor or

text editor and can be viewed in DOS. This version is for DOE Region 4 which includes the following states: Alabama (AL), Florida (FL), Georgia (GA), Kentucky (KY), Mississippi (MS), North Carolina (NC), South Carolina (SC), and Tennessee (TN).

7032 (ESTSC–000721SPARC00) **GPS. General Purpose Simulation.** Geyer, H. (Argonne National Lab, IL (United States)); Ewing, T.F. Argonne National Lab., IL (United States). 13 Jan 1991. Sponsored by Department of Defense, Washington, DC (United States). Source: ESTSC.

Description: SUN SPARC; Sun OS 4.x and OpenWindows 2.0; Sun C; 1 QIC Cartridge. The display graphics were developed in the XView 2.0 and NeWS 2.0 toolkits supplied with OpenWindows 2.0.

GPS is a general purpose simulation framework for system modeling and analysis. Arbitrarily complex systems of component models and interconnecting information flows can be handled. Although developed for the design and analysis of advanced energy system concepts, GPS handles continuous (static or dynamic) or discrete-event simulations. Systems can be assembled in a prototyping fashion from standard software components: component model libraries, property databases, and utility operators (plotters,

solvers, optimizers, etc.) under the control of an interpreted, object-oriented executive language. Systems can be arbitrarily complex in modeling sophistication, and new models can be added easily by the user. GPS also treats arbitrary system constraints over part or all of the system, including the specification of nonlinear objective functions to be minimized subject to equality or nonequality constraints.

7033 (ESTSC–000729IB48600) **SASIL. Sandia ATM SONET Interface Logic.** Kitta, J.P. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). 1 Jul 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Source: ESTSC.

Description: IBM PC 486; MS DOS 5.0 or higher with MicrosAHDL (30%), Altera Graphic Editor (60%), ABEL 5.0 (10%); 1 3.5 Diskette. The source code, which consists of AHDL and schematics generated by the Altera Graphic Editor must be compiled using Altera's MaxPlusII compiler version 4.02 or higher. Programming files created by Altera's MaxPlusII compiler are used to program the Altera EPLD's used to build the Sandia ATM SONET Interface. A programming interface card and a programming adapter, both made by Altera, are required to program Altera EPLD's using the programming files. The ABEL source code must be compiled using Data I/O's ABEL 5.0 compiler. A PAL programmer, made by Data I/O is needed to program the PAL22V10C's. Altera text design files (AHDL files) have a .tdf suffix, and Altera graphic design files (schematics) have a .gdf suffix. Altera also creates some files to represent lower design levels in hierarchial designs. The compiler ...

SASIL is used to program the EPLD's (Erasable Programmable Logic Devices) and PAL's (Programmable Array Logic) that make up a large percentage of the Sandia ATM SONET Interface (OC3 version) for the INTEL Paragon.

7034 (ESTSC–000737IBMPC00) **THCIF. Thermal Hydraulic Calculations for Single-Phase Flow of Incompressible Fluids.** Longest, A.W. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 1 Jan 1987. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; DOS Version 2.0 or higher; LOTUS (TM) 1-2-3 (TM); 1 5.25 Diskette. THCIF operates as a single LOTUS (TM) 1-2-3 (TM) worksheet (or template). A User's guide for THCIF is available and should be consulted before using the software for real calculations.

The LOTUS(TM) 1-2-3(TM) based THCIF program is a convenient engineering tool for flow channel design and evaluation. It can be used to size flow channels to give desired flow rates and heat transfer characteristics, calculate flow rates and heat transfer coefficients for existing channels, calculate pressure drops across flow channel components (e.g., flow contraction, channel friction, flow expansion, and orifice), and calculate coolant temperature distributions for known heat input distributions. The program provides rapid calculations and, being enhanced by the many features of LOTUS(TM) it is easy to use, understand, and modify to suit the user's needs.

7035 (ESTSC–000743IBMPC00) **DDETS. Decontamination and Decommisioning Equipment Tracking System.** Cook, S.D. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Larsen, M.B.; Lively, G.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). 13 Jul 1994. Sponsored by USDOE, Washington, DC (United States). Source: ESTSC.

Description: IBM PC; ORACLE and DOS; ORACLE (90%), C (10%); 4 3.5 Diskettes. DDETS cannot be executed without the Oracle RDBMS software properly loaded and configured on an IBM or compatible PC.

DDETS is Relational Data Base Management System (RDBMS) which incorporates 1-D (code 39) and 2-D (PDF417) bar codes into its equipment tracking capabilities. DDETS is compatible with the Reportable Excess Automated Property System (REAPS), and has add, edit, delete and query capabilities for tracking equipment being decontaminated and decommissioned. In addition, bar code technology is utilized in the inventory tracking and shipping of equipment.

7036 (ESTSC–000750IBMPC00) **ABSIM. Simulation of Absorption Systems in Flexible and Modular Form.** Grossman, G. (Israel Institute of Thechnology, Haifa, (Israel)). Oak Ridge National Lab., TN (United States). 1 Jun 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: ESTSC.

Description: IBM PC; DOS; FORTRAN (70%) C (30%); 1 3.5 Diskette. Executables, data, and text files were supplied with the submitted media. Source and compilation instructions were not supplied with the submitted media. The executables seemed to run without error, but a sample set of input and/or output was not supplied.

The computer code has been developed for simulation of absorption systems at steady-state in a flexible and modular form, making it possible to investigate various cycle configurations with different working fluids. The code is based on unit subroutines containing the governing equations for the system's components. When all the equations have been established, a mathematical solver routine is employed to solve them simultaneously. Property subroutines contained in a separate data base serve to provide thermodynamic properties of the working fluids. The code is user-oriented and requires a relatively simple input containing the given operating conditions and the working fluid at each state point. the user conveys to the computer an image of the cycle by specifying the different components and their interconnections. Based on this information, the program calculates the temperature, flowrate, concentration, pressure and vapor fraction at each state point in the system and the heat duty at each unit, from which the coefficient of performance may be determined. A graphical user-interface is provided to facilitate interactive input and study of the output.

7037 (ESTSC–000751IBMPC00) **BEIDMS1.3. Bechtel Environmental Integrated Database Management System.** Forstrom, K. (Bechtel Environmental Inc., Oak Ridge, TN (United States)); Wallace, J.; Goodwin, D. National Research Council, Washington, DC (United States). Committee on National Urban Policy. 9 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-91OR21949. Source: ESTSC.

Description: IBM PC; MS-DOS; SQL Forms v3.0 (80%), SQL Report Writer v1.1 (2%), SQLMenu v5.0 (5%), ProC v1.2 (10%), MS-DO7 3.5 Diskettes. In the BEIDMS1.3 source code, file extensions are as follows: .BAT MS-DOS command file, .DMM executable for an Oracle SQL*Menu program, .INP source code for an Oracle*Forms program, .FRM executable for an Oracle SQL*Forms program, .REX dump file for an Oracle SQL*ReportWriter program, .REP executable for an Oracle SQL*ReportWriter program, .SQL Oracle SQL*Plus report or script, .PC source code for an Oracle Pro*C program, .H header file for a C program, .C source code for a C program.

Bechtel Environmental Integrated Data Management System (BEIDMS1.3) is an Oracle based relational database that stores data related to all aspects of environmental data collection.

7038 (ESTSC–000752SPARC00) **CVODE. Stiff/Nonstiff Ordinary Differential Eqn Solver in C, Direct and Iterative Metho.** Cohen, S. (Lawrence Livermore National Lab., CA (United States)); Hindmarsh. Lawrence Livermore National Lab., CA (United States). 1 Sep 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Source: ESTSC.

Description: SUN SPARC; Unix; ANSI-C; 1 3.5 Diskette. The package supplied consists of a single archive file, cvode.tar. Installation from this file assumes a Unix system with the tar utility.

CVODE is a package written in ANSI standard C for solving initial value problems for ordinary differential equations. It solves both stiff and non stiff systems. In the stiff case, it includes a variety of options for treating the Jacobian of the system, including dense and band matrix solvers, and a preconditioned Krylov (iterative) solver.

7039 (ESTSC–000757D078000) **SISAL. Parallel Machine Data-Flow Language.** Skedzielewski, S.K. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). 1 Dec 1985. Sponsored by USDOE, Washington, DC (United States). (NESC–9707). Source: ESTSC.

Description: DEC VAX11/780; UNIX; PASCAL; 1 Mag Tape.

SISAL (Streams and Iteration in a Single-Assignment Language) is a functional data-flow language intended for use on a variety of

sequential, vector, multi, and data-flow processors. It is designed to express algorithms for execution on computers capable of highly concurrent operations. The application area supported is numerical computation which strains the limits of high performance machines. IF1 is a set of programs which take IF1 (Intermediate Format) files produced by the SISAL compiler and prepare them for execution on the LLNL debugger/interpreter, which can be used to debug and execute IF1 programs. The set of IF1 programs includes the debugger/interpreter, a prettyprinter for IF1 files, a common subexpression eliminator, an IF1 file structural checker, a loop invariant remover, a loop and test inverter, and programs to topologically sort IF1 files, expand functions inline, and count nodes in IF1 files.

7040 (ESTSC–000758C650000) **2DEPEP. Solves Partial Differential Equations Systems.** Sewell, E.G. (Purdue University, West Lafayette, IN (United States)). Oak Ridge National Lab., TN (United States). 1 Oct 1978. Sponsored by USDOE, Washington, DC (United States). (NESC–806). Source: ESTSC.

Description: CDC6500; SCOPE; FORTRAN IV; 1 Mag Tape. The program is written to process input data for one problem only per execution.

2DEPEP solves the partial differential equation system: C1(X,Y,U,V,T) *DU/DT=D(OXX)/DX+D(OXY)/DY+F1(X,Y,U,V,T) C2(X,Y,U,V,T) *DV/DT=D(OYX)/DX+D(OYY)/DY+F2(X,Y,U,V,T) in a general two-dimensional region, R, with U=FB1(S), V=FB2(S) for S on BR1, and OXX*NX+OXY*NY=GB1(S,U,V,T) OYX*NX+OYY*NY=GB2(S,U,V,T) for S on BR2, where BR1 and BR2 are distinct parts of the boundary. (NX,NY)= unit outward normal. U=UO(X,Y) V=VO(X,Y) for T=TO, and OXX=OXX(X,Y,DU/DX,DU/DY,DV/DX,DV/DY,T) OXY=OXY(X,Y,DU/DX,DU/DY,DV/DX,DV/DY,T) OYX=OYX(X,Y,DU/DX,DU/DY,DV/DX,DV/DY,T) OYY=OYY(X,Y,DU/DX,DU/DY,DV/DX,DV/DY,T). The Jacobian matrices of derivatives of OXX,OXY,OYX,OYY with respect to DU/DX,DU/DY,DV/DX,DV/DY and of F1,F2 with respect to U,V and of GB1,GB2 with respect to U,V must be symetric. The related ellipitic and eigenvalue problems are also solved by 2DEPEP and single equations can be handled efficiently. Examples of applications of the program are elasticity, one or two component diffusion, heat conduction, minimal surface, potential problems, and the time independent and time dependent Schrodinger equations.

7041 (ESTSC–000759IBMPC00) **CIRCUIT2.4. 2-Stage Classification Modeling.** Wilde, R.A. (DOE Idaho Operations Office, Idaho Falls, ID (United States)); Anderson, J.V. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Dec 1987. Sponsored by USDOE, Washington, DC (United States). (NESC–9529). Source: ESTSC.

Description: IBM PC; MS-DOS 2.5 or later; Microsoft FORTRAN 3.3; 2 5.25 Diskettes.

CIRCUIT2.4 is used to design optimum two-stage classification configurations and operating conditions for energy conservation. It permits simulation of five basic grinding-classification circuits, including one single-stage and four two-stage classification arrangements. Hydrocyclones, spiral classifiers, and sieve band screens can be simulated, and the user may choose the combination of devices for the flowsheet simulation. In addition, the user may select from four classification modeling methods to achieve the goals of a simulation project using the most familiar concepts. Circuit performance is modeled based on classification parameters or equipment operating conditions. A modular approach was taken in designing the program, which allows future addition of other models with relatively minor changes.

7042 (ESTSC–000760IBMPC00) **ASENT. Analysis of Sensitivity Experiment Data.** Ashcraft, R.W. (Mason and Hanger Silas Mason Co., Inc., Pantex Plant, Amarillo, TX (United States)). Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). 1 Dec 1987. Sponsored by USDOE, Washington, DC (United States). (NESC–1103). Source: ESTSC.

Description: IBM PC; DOS 3.3; Microsoft QuickBASIC 4.0; 1 5.25 Diskette. Output produced by ASENT can be sent to a disk file or a printer; the plotting routine is written for a high-resolution (CGA) graphics screen. The DOS GRAPHICS.COM is used to print the plots on Epson and IBM compatible printers; this program is not included.

ASENT is designed to provide analysis for several experimental designs, including Probit, Bruceton, and Langlie One-Shot. The program is used for analysis of data from skid, friction, gap, drop hammer, Henkin, and flyer sensitivity tests. ASENT determines the population mean and standard deviation along with their estimated variance and covariance from the stimulus levels used and the number of failures and successes at each level. The population percentiles are also given to any desired confidence level.

7043 (ESTSC–000761IBMPC00) **SOLAR5. Passive Energy Building Design Tool.** Milne, M. (University of California, Los Angeles, CA (United States)). Oak Ridge National Lab., TN (United States). 13 Mar 1984. Sponsored by USDOE, Washington, DC (United States). (NESC–9547). Source: ESTSC.

Description: IBM PC; PC-DOS; Ryan-McFarland FORTRAN; 5 5.25 Diskettes. SOLAR5 uses the FORTPAK/FORLIB PLUS graphic package to generate graphical output. Directives are included to overlay SOLAR5 with the Phoenix Software Associates' PLINK86-Plus linkage editor.

SOLAR5 is a computer aided design tool to help architects design better, more energy efficient buildings. It is intended for use at the beginning of the design process. To get started, only four pieces of information are necessary to compute the energy needed: the square footage, the number of stories, the kind of building (such as school, home, hotel, or any one of 20 types), and its location (the program stores the temperature ranges for fourty major cities). Additional information may be given later to fine tune the design. An expert system using heuristics from a wide range of sources, automatically creates a passive solar baseline building from the four facts specified for that project. By modifying and adapting prior designs the user can create and work upon as many as nine schemes simultaneously. SOLAR5 can analyze the buildings thermal performance for each hour of each month and plot its total heat gain or loss as a three-dimensional surface. After reading the plot, the user can immediately redesign the building and rerun the analysis. Separate heat gain/loss surfaces can be plotted for each of the different parts of the building or schemes that add together to make up the total, including walls, roof, windows, skylights, floor, slab on grade, people, lights, equipment, and infiltration. Two different schemes can be instantly compared by asking for a three-dimensional plot showing only the difference in their performances. The objective of SOLAR5 is to allow the designer to make changes easily and quickly with detailed instantaneous pictorial feedback of the implications of the change.

7044 (ESTSC–000762IBMPC00) **ZIP. Economic Insulation Levels for Houses.** McElroy, D. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 1 Jan 1989. Sponsored by USDOE, Washington, DC (United States). (NESC–9496). Source: ESTSC.

Description: IBM PC; MS-DOS; Microsoft QuickBASIC 4.0; 1 5.25 Diskette.

ZIP was developed to support the calculations and database used to estimate the economic levels of insulation published in the U.S. Department of Energy's Insulation Fact Sheet. The program allows the user to estimate economic levels of insulation for attics, exterior walls, floors over unheated areas, slab floors, and basement and crawlspace walls for new and existing houses in any 3-digit zip code location in the U.S., based on local climate data, local prices for energy and insulation, and the type and estimated efficiency of its heating and cooling system. ZIP recognizes five different heating systems: natural gas, oil furnaces, electric furnaces, electric baseboard, and electric heat pump and two cooling systems: central and window electric air conditioners. An evaporative cooling system can also be specified, but this is not treated as a true air-conditioning system. In addition, the user can specify the approximate operating efficiency of the heating and cooling systems (low, medium, high, or very high). ZIP can be run for a single zip code and specified heating and cooling system or in a batch mode for any number of consecutive zip codes to provide a table of economic insulation levels for use at the state or national level.

7045 (ESTSC–000763I036000) **DENDRO. Hierarchial Cluster Analysis Code.** Larson, N.M. (Oak Ridge National Lab., TN (United States)); Begovich, C.L. Oak Ridge National Lab., TN

(United States). 1 Apr 1980. Sponsored by USDOE, Washington, DC (United States). (NESC–840). Source: ESTSC.

Description: IBM360; OS/360,370; FORTRAN; 1 Mag Tape. Plots are produced using the proprietary Integrated Software Systems Corporation DISSPLA software. The proprietary International Mathematical and Statistical Libraries (IMSL) routine, MDNRIS, for the inverse standard normal (Gaussian) probability distribution function is used, also.

DENDRO performs hierarchial cluster analysis of experimental data with options for data normalization, metrics, and clustering criteria. A dendogram, or tree plot, can be generated on a line printer or plotter illustrating which clusters are combined at what distance.

7046 (ESTSC–000765C660000) **BESSEL FUNCTIONS. Airy & log gamma subroutines.** Amos, D.E. (Sandia National Labs., Albuquerque, NM (United States)); Daniel, S.L. Sandia National Labs., Albuquerque, NM (United States). 2 Sep 1975. Sponsored by USDOE, Washington, DC (United States). (NESC–656). Source: ESTSC.

Description: CDC6600; SCOPE 3.3; FORTRAN IV; 1 Mag Tape. Diagnostic prints are handled from ERRCHK. For Jnu(x), Inu(x), K0(x), K1(x), a non-zero parameter NZ is returned for underflow with a zero value assigned the function.

Subroutines for evaluating Bessel functions: JO(x), J1(x), IO(x), I1(x) for x between + and - infinity; YO(x), Y1(x), KO(x), K1(x) for x greater than zero; Jnu(x), Inu(x) for x greater than or equal to 0 and nu greater than or equal to 0; Yn(x), Kn(x) for x greater than o and n=0,1,2..; Airy functions: Ai(x), Ai'(x), Bi(x), Bi'(x) for x between + and - infinity: and the log gamma function: LNGAMMA(x) for x greater than 0.

7047 (ESTSC–000769C760000) **LOTS. Los Alamos Optical Transport Simulator.** Barnard, C.C. (University of New Mexico, Albuquerque, NM (United States)); Lawrence, G.N.; Munroe, J.L.; Sklar, E. Los Alamos National Lab., NM (United States). 1 May 1983. Sponsored by USDOE, Washington, DC (United States). (NESC–9857). Source: ESTSC.

Description: CDC7600; LTSS; FORTRAN IV; 1 Mag Tape. Both LOTS1 and LOTS2 use routines from two LANL graphics libraries to produce graphical output; these routines are not included and will have to be replaced with suitable local alternatives.

LOTS is a very general code suitable for solving a wide variety of problems in numerical physical optics and beam propagation. It presently exists as two separate releases LOTS1 and LOTS2. The LOTS codes combine a Fast Fourier Transform propagator with a versatile and user friendly command language

7048 (ESTSC–000771IBMPC00) **COALEVAL. Mine-to-market Analysis Low Ash Coal.** Downey, K. (Pittsburgh Energy Technology Center, PA (United States)). USDOE Pittsburgh Energy Technology Center, PA (United States). 31 Mar 1987. Sponsored by USDOE, Washington, DC (United States). (NESC–9544). Source: ESTSC.

Description: IBM PC; DOS; Turbo Pascal; 1 5.25 Diskette. The source language is not available.

COALEVAL is a coal evaluation model (CEM) for assessing technical and economic aspects of producing low ash coals for use in the production of coal water mixtures. Through the use of this model, any coal for which quality and/or washability data exist can be incorporated into a reasonably elaborate mine-to-market coal use scenario. Process performance can be dictated by the user on the basis of specific gravity of separation, recovery of the raw coal heat content, or a specific coal quality parameter such as ash, sulfur, or heating value. Also considered is the option to incorporate pelletizing and/or coal water slurry production. To account for case specific conditions, the operator may separate the various process steps by any selected geographic distance; the model automatically takes into consideration the costs associated with different transportation modes. The model provides a convenient, yet powerful, desk-top tool capable of making rapid approximations of the cost of various coal preparation schemes along with more complex situations where multiple process steps are linked to produce a low-ash coal-based fuel such as coal water mixtures. Additionally, sensitivity analyses of hypothetical mine-to-market scenarios can be performed to focus on those elements where minor changes in efficiency and/or cost will have significant impacts on the delivered product cost. The output of the analysis is displayed on the terminal screen and can be printed in summary report form.

7049 (ESTSC–000772IBMPC00) **RNS. Research Notes and Information References.** Hartley, D.S. III (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). 1 May 1988. Sponsored by Department of Defense, Washington, DC (United States). (NESC–9484). Source: ESTSC.

Description: IBM PC; DOS 3.xx; dBASE III Plus; 1 5.25 Diskette. The proprietary Ashton-Tate dBASE III Plus database management software is required; this software is not included.

The RNS (Research Notes System) is a set of programs and databases designed to aid the research worker in gathering, maintaining, and using notes taken from the literature. The sources for the notes can be books, journal articles, reports, private conversations, conference papers, audiovisuals, etc. The system ties the databases together in a relational structure, thus eliminating data redundancy while providing full access to all the information. The programs provide the means for access and data entry in a way that reduces the key-entry burden for the user. Each note has several data fields. Included are the text of the note, the subject classification (for retrieval), and the reference identification data. These data are divided into four databases: Document data - title, author, publisher, etc., fields to identify the article within the document; Note data - text and page of the note; Sublect data - subject categories to ensure uniform spelling for searches. Additionally, there are subsidiary files used by the system, including database index and temporary work files. The system provides multiple access routes to the notes, both structurally (access method) and topically (through cross-indexing). Output may be directed to a printer or saved as a file for input to word processing software.

7050 (ESTSC–000775IBMPC00) **DEEPWATER. Replacement Cost of Domestic Crude.** Reister, David B. (Oak Ridge National Lab.,TN (United States)). Oak Ridge National Lab., TN (United States). 1 Jun 1988. Sponsored by USDOE, Washington, DC (United States). (NESC–1141). Source: ESTSC.

Description: IBM PC; MS-DOS; FORTRAN; 2 5.25 Diskettes.

The DEEPWATER model forecasts the replacement cost of domestic crude oil for 13 offshore regions in the lower 48 states. The replacement cost of domestic crude oil is the constant or levelized selling price that will recover the full expense of exploration, development, and productions with a reasonable return on capital.

7051 (ESTSC–000776IB48600) **EMAF. Engineering Model for Ash Formation.** Wilemski, Dr. G. (PSI Technology Company, Andover, MA (United States)); Srinivasachar, Dr. S.; Helble, Dr. J.J. Physical Sciences, Inc., Andover, MA (United States). 4 Dec 1994. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90751. Source: ESTSC.

Description: IBM PC 486; DEC Microvax II (VMS version 5.3FORTRAN; 1 3.5 Diskette. The only action required by the user is to write the input file and run the code.

Ash deposition is controlled by the impaction and sticking of individual ash particles to heat transfer surfaces. Prediction of deposition therefore requires that the important factors in this process be predictable from coal and operational parameters. Coal combustion, boiler heat transfer, ash formation, ash particle aerodynamic, and ash particle sticking models are all essential steps in this process. The model described herein addresses the prediction of ash particle size and composition distributions based upon combustion conditions and coal parameters. Key features of the model include a mineral redistribution routine to invert CCSEM mineralogical data, and a mineral interaction routine that simulates the conversion of mineral matter into ash during coal burning and yields ash particle size and composition distributions.

7052 (ESTSC–000777I037000) **ADEPT. aerosol deposition in cylindrical pipes.** Fazekas, P. (Burns and Roe, Oradell, NJ (United States)); Tewarson, S.C. Burns and Roe Enterprises, Inc., Oradell, NJ (United States). 1 Jan 1985. Sponsored by USDOE, Washington, DC (United States). (NESC–9761). Source: ESTSC.

Description: IBM370; MVS; FORTRAN IV; 1 Mag Tape.

ADEPT calculates the deposition of aerosols in straight cylindrical pipes during turbulent air flow. Aerosol deposition is calculated in a time-dependent manner based on empirical correlations for

turbulent flow in pipes. The calculated deposition during a single time interval is cumulative with that of previous time intervals and results in a decreasing inner diameter of the pipe. The calculated deposition is assumed uniform over the length of the pipe. The entering aerosol distribution is specified by the user in the form of a log-normal distribution of accumulated mass versus particle size and may be time dependent. Entering flow conditions are also specified by the user and may also be time dependent. For simplicity and generality, the geometry implicit in the program is that of a cylindrical pipe with no bends or fittings. The flow is turbulent and monodirectional; only one set of inlet conditions may be applied at a given time. The flow parameters are not calculated along the length of pipe; therefore, the dynamic behavior of the aerosol within the pipe as well as the effects of reentrainment cannot be determined explicitly. A typical problem requires 2 minutes of CPU time.

7053 (ESTSC–000779D0VAX00) **MAG. Mag Tape Utility.** Thompson, Charles (Science Applications International Corp., Oak Ridge, TN (United States)); Newman, Gerald K. Los Alamos National Lab., NM (United States). 13 Jul 1986. Sponsored by US-DOE, Washington, DC (United States). Source: ESTSC.

Description: DEC VAX; VMS; MACRO (90%), MESSAGE (10%); 1 8mm Cassette.

MAG is a general-purpose tape utility program which runs on any Digital Equipment Corporation VAX computer system and can write and read fixed-block, fixed-record magnetic tapes. In addition, MAG can read tapes written using ANSI standard record format as well as the IBM Variable Blocked format. Translation from ASCII to EBCDIC and vice versa can be performed.

7054 (ESTSC/NRC/R–000719IBMPC00) **CEMENT1.02. Performance Cement Concrete Nuclear Barriers and Other Components.** Plansky, Dr. L.E. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Seitz, R.R. EG and G Idaho, Inc., Idaho Falls, ID (United States). 13 Mar 1994. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Source: ESTSC.

Description: IBM PC; DOS; FORTRAN 77; 1 3.5 Diskette.

CEMENT is a program that can be used to estimate various aspects of the long term performance of cement-based barriers used in low-level radioactive waste disposal facilities.

7055 (JAERI-M–94-019, pp. 380-386) **An index database of Charged-Particle Nuclear Reaction Data.** Chiba, Masaki (Sapporo Gakuin Univ., Ebetsu, Hokkaido (Japan).); Kato, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1994. (CONF-9311139–: 1993 symposium on nuclear data, Tokai (Japan), 18-19 Nov 1993; INDC(JPN)–169/L). In *Proceedings of the 1993 symposium on nuclear data.* 441p. Order Number DE94785276. Source: OSTI; NTIS; INIS.

We give a brief explanation of a retrieval system for the index information of Charged-Particle Nuclear Reaction Data, which has been installed in Hokkaido University Computing Center. For the installation of these data, the ORION Information Retrieval System has been used. The main purpose of the new system is to open a way for researchers to get benefits from utilizing the Charged-Particle Reaction Data in NRDF and EXFOR systems. (author).

7056 (LA-UR–94-2790) **Network Event Recording Device: An automated system for Network anomaly detection, and notification. Draft.** Simmons, D.G.; Wilkins, R. Los Alamos National Lab., NM (United States). [1994]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950233–1: Internet Society symposium, San Diego, CA (United States), 16-27 Feb 1995). Order Number DE94018274. Source: OSTI; NTIS; GPO Dep.

The goal of the Network Event Recording Device (NERD) is to provide a flexible autonomous system for network logging and notification when significant network anomalies occur. The NERD is also charged with increasing the efficiency and effectiveness of currently implemented network security procedures. While it has always been possible for network and security managers to review log files for evidence of network irregularities, the NERD provides real-time display of network activity, as well as constant monitoring and notification services for managers. Similarly, real-time display and notification of possible security breaches will provide improved effectiveness in combating resource infiltration from both inside and outside the immediate network environment.

7057 (LA-UR–94-3301) **A parallel, portable and versatile treecode.** Warren, M.S. (Los Alamos National Lab., NM (United States)); Salmon, J.K. Los Alamos National Lab., NM (United States). [1994]. 7p. Sponsored by National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950212–1: 7. SIAM conference on parallel processing for scientific computing, San Francisco, CA (United States), 15-17 Feb 1995). Order Number DE95000842. Source: OSTI; NTIS; GPO Dep.

Portability and versatility are important characteristics of a computer program which is meant to be generally useful. We describe how we have developed a parallel N-body treecode to meet these goals. A variety of applications to which the code can be applied are mentioned. Performance of the program is also measured on several machines. A 512 processor Intel Paragon can solve for the forces on 10 million gravitationally interacting particles to 0.5% rms accuracy in 28.6 seconds.

7058 (LBL–34780) **A tool for debugging Internet multicast routing.** Agarwal, D.; Floyd, S. Lawrence Berkeley Lab., CA (United States). Mar 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9403132–2: 1994 ACM symposium on applied computing, Phoenix, AZ (United States), 6-8 Mar 1994). Order Number DE95003433. Source: OSTI; NTIS; GPO Dep.

In this paper the authors describe a debugging tool that is an effective means of analyzing problems with multicast packet routing in a network. Multicast packet routing is a source-driven distributed calculation performed by the routers in a multicast network. The routes taken by multicast packets are difficult to predict manually due to the large number of variables that must be considered. The multicast route debugging tool allows off-line investigation of the route taken by a multicast packet and the effects of network modifications on that route. The tool has already proved useful in debugging the problems that have occurred in the experimental Internet Multicast Backbone. The multicast route debugging tool currently predicts multicast routes of packets using the distance-vector truncated-broadcast algorithm implemented for Internet multicast traffic. They will be upgrading the tool to allow the user to choose other multicast routing algorithms.

7059 (SAND–92-2137) **EXODUS II: A finite element data model.** Schoof, L.A.; Yarberry, V.R. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. 239p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004267. Source: OSTI; NTIS; GPO Dep.

EXODUS II is a model developed to store and retrieve data for finite element analyses. It is used for preprocessing (problem definition), postprocessing (results visualization), as well as code to code data transfer. An EXODUS II data file is a random access, machine independent, binary file that is written and read via C, C++, or Fortran library routines which comprise the Application Programming Interface (API).

7060 (SAND–94-2420C) **Dynamic load balancing for parallel finite element methods with adaptive h- and p-refinement.** Devine, K.D. (Sandia National Labs., Albuquerque, NM (United States)); Flaherty, J.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950212–4: 7. SIAM conference on parallel processing for scientific computing, San Francisco, CA (United States), 15-17 Feb 1995). Order Number DE95004521. Source: OSTI; NTIS; GPO Dep.

We describe a dynamic load-balancing strategy for parallel finite element methods with adaptive mesh (h-) and order (p-) refinement. The load-balancing algorithm is based on the tiling load-balancing system, where global balance in achieved by performing local balancing within overlapping neighborhoods of processors. Tiling is applied to each mesh level created by the adaptive h-refinement. Weights are used in the migration routines to reflect the nonuniform elemental work loads caused by adaptive p-refinement. The combination of adaptive refinement and tiling

significantly reduces total execution time relative to fixed-mesh, fixed-order methods yielding comparable accuracy, as we demonstrate with experiments on an nCUBE/2.

7061 (SAND–94-2444C) **Parallel algorithms for dynamically partitioning unstructured grids.** Diniz, P. (University of California, Santa Barbara (United States). Dept. of Computer Science); Plimpton, S.; Hendrickson, B.; Leland, R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950212–2: 7. SIAM conference on parallel processing for scientific computing, San Francisco, CA (United States), 15-17 Feb 1995). Order Number DE95001616. Source: OSTI; NTIS; GPO Dep.

Grid partitioning is the method of choice for decomposing a wide variety of computational problems into naturally parallel pieces. In problems where computational load on the grid or the grid itself changes as the simulation progresses, the ability to repartition dynamically and in parallel is attractive for achieving higher performance. We describe three algorithms suitable for parallel dynamic load-balancing which attempt to partition unstructured grids so that computational load is balanced and communication is minimized. The execution time of algorithms and the quality of the partitions they generate are compared to results from serial partitioners for two large grids. The integration of the algorithms into a parallel particle simulation is also briefly discussed.

7062 (SAND–94-3112C) **A review of research and methods for producing high-consequence software.** Collins, E.; Dalton, L.; Peercy, D.; Pollock, G.; Sicking, C. Sandia National Labs., Albuquerque, NM (United States). [1994]. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950258–1: 1995 Institute of Electrical and Electronics Engineers (IEEE) aerospace applications conference, Snowmass, CO (United States), 13-17 Feb 1995). Order Number DE95004522. Source: OSTI; NTIS; GPO Dep.

The development of software for use in high-consequence systems mandates rigorous (formal) processes, methods, and techniques to improve the safety characteristics of those systems. This paper provides a brief overview of current research and practices in high-consequence software, including applied design methods. Some of the practices that are discussed include: fault tree analysis, failure mode effects analysis, petri nets, both hardware and software interlocks, n-version programming, Independent Vulnerability Analyses, and watchdogs. Techniques that offer improvement in the dependability of software in high-consequence systems applications are identified and discussed. Limitations of these techniques are also explored. Research in formal methods, the cleanroom process, and reliability models are reviewed. In addition, current work by several leading researchers as well as approaches being used by leading practitioners are examined.

7063 (UCRL-JC–116899) **A technical approach for determining the importance of information in computerized alarm systems.** Fortney, D.S. (Lawrence Livermore National Lab., CA (United States)); Lim, J.J. Lawrence Livermore National Lab., CA (United States). 10 Jun 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410140–2: 17. national computer security conference, Baltimore, MD (United States), 11-14 Oct 1994). Order Number DE95004211. Source: OSTI; NTIS; GPO Dep.

Computerized alarm and access control systems must be treated as special entities rather than as generic automated information systems. This distinction arises due to the real-time control and monitoring functions performed by these systems at classified facilities and the degree of centralization of a site's safeguards system information in the associated databases. As an added requirement for these systems, DOE safeguards and security classification policy is to protect information whose dissemination has the potential for significantly increasing the probability of successful adversary action against the facility, or lowering adversary resources needed for a successful attack. Thus at issue is just how valuable would specific alarm system information be to an adversary with a higher order objective. We have developed and applied a technical approach for determining the importance of information contained in computerized alarm and access control systems. The methodology is based on vulnerability assessment rather than blanket classification rules. This method uses a system architecture diagram to guide the analysis and to develop adversary defeat methods for each node and link. These defeat methods are evaluated with respect to required adversary resources, technical difficulty, and detection capability. Then they are incorporated into site vulnerability assessments to determine the significance of alarm system information in the context of a facility attack. This methodology was successfully applied to the Argus alarm, access control, and assessment system developed at the Lawrence Livermore National Lab. Argus is software-driven, contains interrelated databases, shares host computers, and communicates with field processors and alarms through a common network. The evaluation results provided insights into the importance of alarm system information while the methodology itself provided a framework for addressing associated information protection issues.

7064 (UCRL-JC–118448) **Debugging the virtual machine.** Miller, P.; Pizzi, R. Lawrence Livermore National Lab., CA (United States). 2 Sep 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950242–1: Symposium on applied computing (SAC '95), Nashville, TN (United States), 26-28 Feb 1995). Order Number DE95002193. Source: OSTI; NTIS; GPO Dep.

A computer program is really nothing more than a virtual machine built to perform a task. The program's source code expresses abstract constructs using low level language features. When a virtual machine breaks, it can be very difficult to debug because typical debuggers provide only low level machine implementation in formation to the software engineer. We believe that the debugging task can be simplified by introducing aspects of the abstract design into the source code. We introduce OODIE, an object-oriented language extension that allows programmers to specify a virtual debugging environment which includes the design and abstract data types of the virtual machine.

7065 (WHC-SD-GN-ER–30033) **Verification and validation of decision support software: Expert Choice™ and PCM™.** Nguyen, Q.H.; Martin, J.D. Westinghouse Hanford Co., Richland, WA (United States). 4 Nov 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004469. Source: OSTI; NTIS; GPO Dep.

This report documents the verification and validation of two decision support programs: EXPERT CHOICE™ and PCM™. Both programs use the Analytic Hierarchy Process (AHP) – or pairwise comparison technique – developed by Dr. Thomas L. Saaty. In order to provide an independent method for the validating the two programs, the pairwise comparison algorithm was developed for a standard mathematical program. A standard data set – selecting a car to purchase – was used with each of the three programs for validation. The results show that both commercial programs performed correctly.

7066 (CRIE-R–93003) **Survey on introducing expert systems in office works at electric power companies.** Usagawa, T.; Bannai, K. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Jan 1994. 21p. (In Japanese). Order Number DE95730178. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A survey was made on the following themes to be appropriately applied to the expert system for the office work in the electric power company: business-related themes to support the dealing with clients, accumulation of basic business know-how and retrieval of detailed charges. General-affairs related themes to support the consultation about the stock and compensation for the damage, and business procedure in the company. The application of expert systems which are common to all the themes aims at the four items which are accumulation and common application of business

know-how, business progress management, educational support, and self-enlightenment. It is important to clearly comprehend those items for establishing the expert system. The needs-related concept and efficiency-related concept are called for in the selection of themes. The former concept covers the service improvement, business efficiency heightening, resources saving and degree of needs, while the latter does the degree of generalization, management unification, accumulation of know-how and experience, degree of appeal, and educational support. The model system must be experimentally built for the execution. 2 refs., 7 tabs.

7067 (CRIE-R–93015) **Integrated resource management database for a distributed information system.** Futakata, A. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 24p. (In Japanese). Order Number DE95730180. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

An integrated resource management database was reported which was developed for the distributed information system. In that system, various systems fluctuate fluidly with dispersion of information resources such as data and process. Therefore, relation is difficult to grasp among those resources, and the information system is also difficult to manage. In order to express those resources and their mutual relation, a business information model which could give both data-oriented and process-oriented views was developed and so hierarchically structured as to detail the description. Based on that model, an integrated resource management database was further developed which generalized and managed the information resources. Thus, the influence analysis of change in system and maintenance of data conformity are expected to be eased. A system was also experimentally prepared which supported the structure based on a proposed methodology to structure the business information model. As a result, it was confirmed that the present database is easy to grasp by the managers and excellent in maintenance properties. 12 refs., 10 figs., 1 tab.

7068 (CRIE-R–94001) **Survey of methods for secure connection to the internet.** Matsui, S. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Apr 1994. 24p. (In Japanese). Order Number DE95730185. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

This paper describes a study of a security method of protecting inside network computers against outside miscreants and unwelcome visitors and a control method when these computers are connected with the Internet. In the present Internet, a method to encipher all data cannot be used, so that it is necessary to utilize PEM (Privacy Enhanced Mail) capable of the encipherment and conversion of secret information. For preventing miscreant access by eavesdropping password, one-time password is effective. The most cost-effective method is a firewall system. This system lies between the outside and inside network. By limiting computers that directly communicate with the Internet, control is centralized and inside network Security is protected. If the security of firewall systems is strictly controlled under correct setting, security within the network can be secured even in open networks such as the Internet. 35 refs., 3 figs.

7069 (CRIE-R–94002) **Downsizing systems and expected opposition to introduction.** Tokoro, K. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Apr 1994. 27p. (In Japanese). Order Number DE95730186. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

The proper use of downsizing systems and mainframe systems was studied for the purpose of introducing, advantages of downsizing while utilizing existing information systems. Downsizing has four features: high cost performance, high flexibility and expandability, highly functional interface, and a horizontal linkage system. But compared with centralized systems, downsizing systems entail higher operation and control costs. Downsizing introduction technology has not yet been established in the field of systematization where renewal of corporate data, high security, and mass high-speed printing are required. Downsizing is suitable for fields where systematization is difficult with centralized systems, characteristics of downsizing can be fully demonstrated, and advanced and established technology is not needed. Specific examples of its application are the support of decision making, creative work, and group operation. For improving the performance of the downsizing system as a whole, its application to computers on the network, and distributed data arrangement are important. 15 refs.

7070 (DOE/DP/70033–T1) **Research and development of models and instruments to define, measure, and improve shared information processing with government oversight agencies. An analysis of the literature, August 1990–January 1992.** Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Management Systems Labs. [1992]. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86DP70033. Order Number DE94017792. Source: OSTI; NTIS; GPO Dep.

This document identifies elements of sharing, plus key variables of each and their interrelationships. The document's model of sharing is intended to help management systems' users understand what sharing is and how to integrate it with information processing.

7071 (DOE/HR–0083) **Information technology standards process guide.** USDOE Assistant Secretary for Human Resources and Administration, Washington, DC (United States). Apr 1994. 33p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95003967. Source: OSTI; NTIS; GPO Dep.

This document presents a logical and realistic approach to implementation of the Information Technology Standards Program throughout the Department and its management and operating contractors, as described in Department of Energy 1360.3C, Information Technology Standards, dated October 19, 1992. To take better advantage of commercial advances and investments in information technology resources, it is paramount that the Department of Energy move as rapidly as programmatically feasible to an open systems environment. The process revolves around the selection of interface standards in areas such as multi-system and multi-processor interconnects, operating and database management systems, graphics, and security. This new approach will result in reduced production, operation, and maintenance costs, and more effective system integration. The Information Technology Standards Process Guide provides a model that may be tailored to Department of Energy sites. It also assists sites in understanding the Information Technology Standards Program. It is not an architectural description to be used in implementing a corporate information systems environment.

7072 (ES/ER/TM–120/V3) **Information management architecture for an integrated computing environment for the Environmental Restoration Program. Environmental Restoration Program, Volume 3, Interim technical architecture.** Oak Ridge National Lab., TN (United States). Sep 1994. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95001386. Source: OSTI; NTIS; INIS; GPO Dep.

This third volume of the Information Management Architecture for an Integrated Computing Environment for the Environmental Restoration Program–the Interim Technical Architecture (TA) (referred to throughout the remainder of this document as the ER TA)–represents a key milestone in establishing a coordinated information management environment in which information initiatives can be pursued with the confidence that redundancy and inconsistencies will be held to a minimum. This architecture is intended to be used as a reference by anyone whose responsibilities include the acquisition or development of information technology for use by the ER Program. The interim ER TA provides technical guidance at three levels. At the highest level, the technical architecture provides an overall computing philosophy or direction. At this level, the guidance does not address specific technologies or products but addresses more general concepts, such as the use of open systems, modular architectures, graphical user interfaces, and architecture-based development. At the next level, the technical architecture provides specific information technology recommendations regarding a wide variety of specific technologies. These technologies include computing hardware, operating systems, communications software, database management software, application development software, and personal productivity software, among others. These recommendations range from the adoption of specific

industry or Martin Marietta Energy Systems, Inc. (Energy Systems) standards to the specification of individual products. At the third level, the architecture provides guidance regarding implementation strategies for the recommended technologies that can be applied to individual projects and to the ER Program as a whole.

7073 (LA-UR–94-3835) **A network-based distributed, media-rich computing and information environment.** Phillips, R.L. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941118–9: Supercomputing '94 meeting; Digital media and electronic publishing conference, Washington, DC (United States); Leeds (United Kingdom), 14-18 Nov 1994; 6-8 dec 1994; CONF-941243–1). Order Number DE95003696. Source: OSTI; NTIS; GPO Dep.

Sunrise is a Los Alamos National Laboratory (LANL) project started in October 1993. It is intended to be a prototype National Information Infrastructure development project. A main focus of Sunrise is to tie together enabling technologies (networking, object-oriented distributed computing, graphical interfaces, security, multi-media technologies, and data-mining technologies) with several specific applications. A diverse set of application areas was chosen to ensure that the solutions developed in the project are as generic as possible. Some of the application areas are materials modeling, medical records and image analysis, transportation simulations, and K-12 education. This paper provides a description of Sunrise and a view of the architecture and objectives of this evolving project. The primary objectives of Sunrise are three-fold: (1) To develop common information-enabling tools for advanced scientific research and its applications to industry; (2) To enhance the capabilities of important research programs at the Laboratory; (3) To define a new way of collaboration between computer science and industrially-relevant research.

7074 (SAND–94-2764C) **The energy intelligence information system.** Malczynski, L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410237–1: 1994 Geographic Information Systems/Land Information Systems (GIS/LIS), Phoenix, AZ (United States), 25-27 Oct 1994). Order Number DE95002184. Source: OSTI; NTIS; GPO Dep.

The safety and security of foreign nuclear facilities is an important topic for intelligence services. This has been made more important by the breakup of the Former Soviet Union. The major requirement of intelligence analysts is rapid information retrieval after the report of an incident at a foreign facility. Sandia National Laboratories is developing a GIS-based Energy Intelligence Information System (EIIS) to help analysts at The Office of Energy Intelligence of the Department of Energy formulate a response to a nuclear incident. The Vital Issues process was used to determine which information might be the most important to collect. Joint Applications Design and prototyping sessions were held to establish EIIS requirements and refine the user interface. EIIS was built to access any point on the globe or to move directly to a site, facility, or city. The EIIS version 1.0 concentrates on commercial reactors, version 2.0 will include other nuclear fuel cycle sites and release 3.0 will include waste and disposal information. The system runs on a SUN workstation using ARC/INFO™ and Informix as the RDBMS. The map system relies upon the Digital Chart of the World from the Defense Mapping Agency.

7075 (WHC-SA–2594) **Measuring the strategic value of information technology investments.** Conrad, K.W. (Boeing Computer Services Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-940873–3: 11. office information technology conference, Chicago, IL (United States), 23-25 Aug 1994). Order Number DE94018160. Source: OSTI; NTIS; INIS; GPO Dep.

Value is often perceived differently by the proponents of new information technologies and those who allocate resources and define priorities. Such differences often become a roadblock to meeting true business needs. Project justifications regularly rely on calculated cost savings, which rarely measure the full benefit of new technologies. In fact, if cost savings provide a complete picture, then the organization is probably just automating routine clerical operations and has abandoned efforts that would provide significant strategic value. Strategic value is not limited to financial calculations, but includes quality, time and risk criteria. This paper describes approaches for measuring strategic value that can provide organizations with proven techniques to improve performance, reengineer processes, benchmark performance against other suppliers, identify outsourcing opportunities, or defend themselves from pressures to outsource. Many organizations respond to tightening budgets by cutting overhead. These measurement approaches can demonstrate how overhead is critical to organizational effectiveness and how cost savings can be found, instead, by measurably improving performance throughout the organization. Finally, the paper describes efforts underway within the Department of Energy and at the Hanford Site to implement the approaches described in this paper.

7076 (WHC-SD-GN-CSDD–30006-Rev.1) **Search Hanford accessible reports electronically system design description. Revision 1.** Gilomen, T.L. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004369. Source: OSTI; NTIS; GPO Dep.

The Search Hanford Accessible Records Electronically (SHARE) system was produced by a combined team of personnel from Westinghouse Hanford Company (WHC) Corrective Action Data Systems (CADS) and Information Resource Management (IRM) Information and Scientific Systems (ISS) organizations. The ESQD Text Evaluation and exchange Tool (ETEXT) prototype was used as a basis for the requirements used to support this design/build effort. TOPIC was used to build the SHARE application. TOPIC is a text search and retrieval software product produced by the Verity Corporation. The TOPIC source code is not provided with the product, and the programs cannot be changed. TOPIC can be customized for special requirements. The software is fully documented. Help messages, menu and screen layouts, command edits and options, and internal system design are all described in the TOPIC documentation. This System Design Description (SDD) will not reiterate the TOPIC documentation and design. Instead, it will focus on the SHARE installation of TOPIC. This SDD is designed to assist the SHARE database/infobase administrator (DBA) in maintaining and supporting the application. It assumes that the assigned DBA is knowledgeable in using the TOPIC product, and is also knowledgeable in using a personal computer (PC), Disk Operating System (DOS) commands, and the document WHC-CM-3-10. SHARE is an Impact Level 4 system, and all activities related to SHARE must conform with the WHC-CM-3-10 procedures for an Impact Level 4 system. The Alternatives Analysis will be treated as a level 3-Q document, to allow for reference by potential future projects.

7077 (WHC-SD-GN-CSRS–30008-Rev.1) **Search Hanford accessible reports electronically system requirements specification.** Willers, K.J. Westinghouse Hanford Co., Richland, WA (United States). 28 Feb 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004367. Source: OSTI; NTIS; GPO Dep.

The Emergency, Safety, & Quality (ESQ) Services organization of Westinghouse Hanford Company (WHC) is experiencing changes related to new programs. The programs include Corrective Actions Management Systems, Self-Assessment, Trend Analysis, and Lessons Learned analysis. The programs are pushing up organizational costs while funding and manpower levels are projected to be dropping. A large cost involved in implementing the new programs is the cost for people to locate unstructured information required to make decisions or write documentation. But, most resources for retrieving information are found in structured database systems. This means that unstructured information that must be located has to be found by one of these methods: (1) searching manually through documents, (2) searching individual documents one at a time with word processing programs, (3) searching through text fields with query systems primarily designed for structured database information, or (4) develop a text search and retrieval system designed for unstructured information. One example of this is using Occurrence Reporting Processing System

(ORPS) and Quality, Environmental, and Safety Tracking (QUEST) documents. An explanation of this is in the following textual box.

7078 (WHC-SD-GN-CSWD–30057-Rev.1) **Search Hanford Accessible Reports Electronically system test plan and documentation: Revision 1.** White, E.L. Westinghouse Hanford Co., Richland, WA (United States). 7 Dec 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004368. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to describe the following items: the approach, resources, and sequence of the testing activities; identifies the components and features to be tested; the personnel responsible for testing; the risks associated with this plan; and test cases and procedures. This document contains all test documentation for the SHARE system. The Search Hanford Accessible Reports Electronically (SHARE) testing process is based upon WHC-CM-3-10, Software Practices, Section SP-3.3 REV 0, and Appendix J REV 0. These procedures and guidelines are based on IEEE Standard 829-1983. The planning in this document was further influenced through guidance in IEEE Standard 1012-1986. This document contains the System, Acceptance, Integration and Component Test Plans, Designs, Procedures, and Cases for SHARE. The Test Cases and procedures have been attached to the document.

7079 (WHC-SD-GN-SP–30001) **HIMACS file management software and strategies.** Rohen, W.T. Westinghouse Hanford Co., Richland, WA (United States). 30 Sep 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004109. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

This document discusses the various file management technologies available for potential use with microcomputers at Hanford.

7080 (WHC-SD-HWV-UM–004-Rev.1) **Activity Management System user reference manual. Revision 1.** Gates, T.A.; Burdick, M.B. Westinghouse Hanford Co., Richland, WA (United States). 22 Sep 1994. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95000989. Source: OSTI; NTIS; INIS; GPO Dep.

The Activity Management System (AMS) was developed in response to the need for a simple-to-use, low-cost, user interface system for collecting and logging Hanford Waste Vitrification Plant Project (HWVP) activities. This system needed to run on user workstations and provide common user access to a database stored on a local network file server. Most important, users wanted a system that provided a management tool that supported their individual process for completing activities. Existing system treated the performer as a tool of the system. All AMS data is maintained in encrypted format. Users can feel confident that any activities they have entered into the database are private and that, as the originator, they retain sole control over who can see them. Once entered into the AMS database, the activities cannot be accessed by anyone other than the originator, the designated agent, or by authorized viewers who have been explicitly granted the right to look at specific activities by the originator. This user guide is intended to assist new AMS users in learning how to use the application and, after the initial learning process, will serve as an ongoing reference for experienced users in performing infrequently used functions. Online help screens provide reference to some of the key information in this manual. Additional help screens, encompassing all the applicable material in this manual, will be incorporated into future AMS revisions. A third, and most important, source of help is the AMS administrator(s). This guide describes the initial production version of AMS, which has been designated Revision 1.0.

7081 (WHC-SD-WM-DP–089) **Data management plan for the ultrasonic inspection of the double-shell tanks.** Harris, J. Westinghouse Hanford Co., Richland, WA (United States). 30 Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95001542. Source: OSTI; NTIS; INIS; GPO Dep.

To obtain an operating permit from Washington State Department of Ecology, Westinghouse Hanford Company (WHC) must assess the double-shell tanks (DST) for structural integrity. The assessment includes volumetric examinations of the primary steel tank and secondary steel liner. The integrity of the tanks will be assessed by remote ultrasonic (UT) inspections of the primary and secondary steel tanks to measure wall thickness and detect corrosion pitting and stress corrosion cracking. The surfaces of the areas to be inspected will be cleaned with a power wire brush to remove loose mill scale, rust, and other materials that could inhibit proper coupling of the UT probe. To ensure that the cleaning process is satisfactory, the cleaned area will be viewed with a video camera and recorded. The video and UT equipment will be calibrated the ensure accuracy, and a performance test will be conducted to verify its capabilities. The tank inspection sequence consists of cleaning, visual examination, and UT inspection of each region selected for inspection: the primary tank wall, the tank bottom and lower knuckle, and the secondary tank wall. A significant amount of data will be collected and reported during these examinations. This data management plan (DMP) describes the data produced by the examinations and how and where the data are to be stored.

7082 (WHC-SD-WM-SWD–015) **Liquid Effluent Monitoring Information System (LEMIS) System Construction.** Adams, R.T. Westinghouse Hanford Co., Richland, WA (United States). 11 Oct 1994. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002242. Source: OSTI; NTIS; INIS; GPO Dep.

The liquid effluent sampling program is part of the effort to minimize adverse environmental impact during the cleanup operation at the Hanford Site. Of the 33 Phase I and Phase II liquid effluents, all streams actively discharged to the soil column will be sampled. The Liquid Effluent Monitoring Information System (LEMIS) is being developed as the organized information repository facility in support of the liquid effluent monitoring requirements of the Tri-Party Agreement. It is necessary to provide an automated repository into which the results from liquid effluent sampling will be placed. This repository must provide for effective retention, review, and retrieval of selected sample data by authorized persons and organizations. This System Construction document is the aggregation of the DMR P+ methodology project management deliverables. Together they represent a description of the project and its plan through four Releases, corresponding to the definition and prioritization of requirements defined by the user.

7083 (INIS-mf–14425) **Statutory Instrument No 48 of 1992. Radiological Protection Act, 1991 (Establishment day) Order, 1992.** Ireland. Mar 1992. 1p. Order Number DE95611312. Source: OSTI; NTIS (US Sales Only); INIS.

This order appoints 1st April 1992 as the day on which the Radiological Protection Institute of Ireland is established. From that day the Radiological Protection Institute of Ireland will take over the functions of An Bord Fuinnimh Nuicleigh.

7084 (INIS-mf–14426) **Statutory Instrument No 144 of 1992. Convention on assistance in the case of a nuclear accident or radiological emergency (privileges and immunities) order, 1992.** Ireland. Feb 1992. 7p. Order Number DE95611313. Source: OSTI; NTIS (US Sales Only); INIS.

This Order is made by the power conferred on the Government by Section 42A of the Diplomatic Relations and Immunities Acts, 1967 and 1976. It enables the Government to afford immunity from legal action and exemption from taxes to foreign rescue workers as required under Article 8 of the Convention on Assistance in the case of a Nuclear Accident or Radiological Emergency to which the State is a party.

7085 (INIS-mf–14427) **Statutory Instrument No 151 of 1993. Radiological Protection Act, 1991 (General control of radioactive substances, nuclear devices and irradiating apparatus) Order, 1993.** Ireland. Jun 1993. 12p. Order Number DE95611314. Source: OSTI; NTIS (US Sales Only); INIS.

This Order has the effect of revoking and replacing the Nuclear Energy (General Control of Fissile Fuels, Radioactive Substances

and Irradiating Apparatus) Order, 1977 (S.I. No. 166 of 1977). It provides for the control by licence, to be obtained from the Radiological Protection Institute of Ireland, of the custody, transportation, handling, holding, storage, use, manufacture, production, processing, importation, distribution, exportation, or other disposal of radioactive substances, nuclear devices or irradiating apparatus, as defined in the Order. This Order also completes the implementation of Council Directive 80/836/EURATOM of 15 July, 1980, as amended by Council Directive 84/467/EURATOM of 3 September, 1984, laying down the basic safety standards for the health protection of the general public and workers against the dangers of ionising radiation.

7086 (INIS-XN–507) **Cooperation Agreement between the Government of Australia and the European Orgaization for Nuclear Research (CERN) concerning the further development of scientific and technical co-operation in the research projects of CERN Ministry - Regulatory Decree No 3/92 of 6 March.** Australia. 1 Nov 1991. 7p. Order Number DE95611309. Source: OSTI; NTIS (US Sales Only); INIS.

The agreement provides for co-operation on research projects. Australian specialists may participate in CERN research projects, in particular in connection with the Large Electron-Position Collider-LEP. The Agreement entered into force on the date of its signature for an initial period of five years and is renewable. (NEA).

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in ETDE/PUB–3 (Rev.1), *International Energy: Research Organizations 1988–1992*. Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, indicated by International Organization for Standardization (ISO) country code; and (3) the language of the document if non-English (R;CA;In French). Author affiliations are not listed in this index.

AMAX Research and Development Center, Golden, CO (United States)
Engineering development of advanced physical fine coal cleaning for premium fuel applications. Quarterly technical progress report No. 7, April 1, 1994–June 30, 1994, 20:4900 (R;US)

AN SSSR, Moscow (Russian Federation)
A new technique for analyzing crystal structures by electron channeling image processing, 20:6839 (IA;RU;In Russian)
A set of programs describing electromagnetic processes at relativistic particle motion in the periodic potential of crystal field, 20:6843 (IA;RU;In Russian)
Accumulation of radiation defects in silicon at high-energy ion implantation, 20:6847 (IA;RU;In Russian)
Accurate measurement of oxigen profule in oxide films using resonance in helium ion elastic scattering at the energy of 3,045 MeV, 20:6823 (IA;RU;In Russian)
Acoustic analysis of the efficiency of beam deflection by a bended crystal, 20:6835 (IA;RU;In Russian)
Anomalous peculiarities and positron-like channeling of relativistic electron in magnetic crystals, 20:6834 (IA;RU;In Russian)
Antiproton channeling, 20:6836 (IA;RU;In Russian)
Calculation of ion depth distribution at axial channeling with the allowance for multiple scattering and energy loss fluctuations, 20:6841 (IA;RU;In Russian)
Calculation of radiation and pair production probabilities at arbitrary incidence angles to crystal planes, 20:6803 (IA;RU;In Russian)
Changes in electrophysical properties of silicon at multistep ion implantation, 20:6840 (IA;RU;In Russian)
Coherent excitation of Ne^{9+} ion in Au crystal. Computerized simulation, 20:6832 (IA;RU;In Russian)
Coherent photoproduction of a relativistic positronium atom, 20:6818 (IA;RU;In Russian)
Comparison of characteristics of coherent radiations from crystals and periodic radiators, 20:6801 (IA;RU;In Russian)
Comparison of diffraction intensity of bremsstrahlung photons and parametric X-radiation, 20:6804 (IA;RU;In Russian)
Coulomb excitation of nuclei in crystals by protons and antiprotons, 20:6833 (IA;RU;In Russian)
Crystal structure of multilayered HTSC films investigated by the method of mean energy ion scattering, 20:6825 (IA;RU;In Russian)
Defect formation in silicon irradiated by high-energy argon ions, 20:6848 (IA;RU;In Russian)
Determination of a deformation profile in alpha-irradiated lead chalcogenide films, 20:6821 (IA;RU;In Russian)
Diffusion of boron implanted into silicon irradiated by high-energy argon ions, 20:6846 (IA;RU;In Russian)
Distortions in B-type coherent bremsstrahlung spectra of channeling relativistic electrons, 20:6844 (IA;RU;In Russian)
Electron channeling and electron microscopy of atomic resolution, 20:6831 (IA;RU;In Russian)
Energy dependence of the intensity of backscattering of fast electrons by highly symmetric crystals, 20:6838 (IA;RU;In Russian)
Estimation of the degree of authenticity of concentrational element profile derived from RBS measurements, 20:6827 (IA;RU;In Russian)
Evaluation of the Bragg law fluctuation at the calculation of proton slowing-down in SiO_2, 20:6798 (IA;RU;In Russian)
Fluctuations of polarization fields, 20:6799 (IA;RU;In Russian)
Influence of ion flux density and irradiation time on the long-range interaction effect, 20:6849 (IA;RU;In Russian)
Interaction of oxygen ions with the crystal lattice of Si-detector at channeling, 20:6837 (IA;RU;In Russian)
Internuclear axis orientation effects at molecular ion dissociation in metal surface, 20:6855 (IA;RU;In Russian)
Li impurity atom position in $Nd_2CuO_{4-\delta}$ crystal lattice, 20:6822 (IA;RU;In Russian)
Nuclear physics methods of the determination of oxygen content in materials, 20:6824 (IA;RU;In Russian)
On the possibility of one-frequency quasicharacteristic radiation generation at coherent channeling in crystals, 20:6842 (IA;RU;In Russian)
Oxygen position in silicon, 20:6852 (IA;RU;In Russian)
Photoproduction of a hypothetic neutral particle in oriented monocrystal, 20:6757 (IA;RU;In Russian)
Proceedings of 22. international meeting on the physics of interaction of charged particles with crystals, 20:6830 (I;RU;In Russian)
Radiation defects and thermal stability of $A^{IV}B^{VI}$ films at proton irradiation, 20:6854 (IA;RU;In Russian)

Radiation-acoustic study of a superconducting state in $YBa_2Cu_3O_7$, 20:6860 (IA;RU;In Russian)
Reconstruction of impurity concentration profile by the resonance nuclear reaction method, 20:6826 (IA;RU;In Russian)
Stopping power of solid absorbers for nitrogen and carbon ions in the range of maximum stopping power curve, 20:6800 (IA;RU;In Russian)
Structural changes in GaAs doped with selenium ions, 20:6850 (IA;RU;In Russian)
Study of coherent pair production of B type in silicon crystal, 20:6802 (IA;RU;In Russian)
Study of positron beam production at electron channeling in tungsten, 20:6845 (IA;RU;In Russian)
The effect of low-energy oxygen ions on structural perfection of monocrystalline films of yttrium ferrite-garnets, 20:6820 (IA;RU;In Russian)
The effect of size-energy factor on mass transfer at ion implantation of two-layer films, 20:6851 (IA;RU;In Russian)
The influence of defect thermal stability on ion-induced crystallization, 20:6853 (IA;RU;In Russian)

APTEK, Inc., Colorado Springs, CO (United States)
Final report for confinement vessel analysis: Task 1, Correlation of new vessel data with finite element results, 20:6473 (R;US)
Final report for confinement vessel analysis. Task 2, Safety vessel impact analyses, 20:6474 (R;US)
Final report for confinement vessel analysis. Task 3, Analysis of confinement vessel doors, 20:6475 (R;US)

Argonne National Lab., Idaho Falls, ID (United States)
Computer imaging of EBR-II handling equipment, 20:5732 (R;US)

Argonne National Lab., IL (United States)
1993 CAT workshop on beamline optical designs, 20:6384 (R;US)
A comparison of WIMS-D4 and WIMS-D4m generated cross-section data with Monte Carlo, 20:5852 (RA;US)
A double-multilayer monochromator using a modular design for the Advanced Photon Source, 20:6421 (R;US)
A new swelling model and its application to uranium silicide research reactor fuel, 20:5844 (RA;US)
A new X-ray inspection of fuel plates, 20:5815 (RA;US)
A swelling model of LEU silicide fuel for KMRR, 20:5843 (RA;US)
Analyses for conversion of the Georgia Tech Research Reactor from HEU to LEU fuel, 20:5850 (RA;US)
Analytical analyses of startup measurements associated with the first use of LEU fuel in Romania's 14-MW TRIGA reactor, 20:5840 (RA;US)
Atomic physics at high brilliance synchrotron sources: Proceedings, 20:6808 (R;US)
BCS-like gap structure of $HgBa_2CuO_{4+\delta}$ tunnel junctions, 20:6858 (R;US)
Beamline standard component designs for the Advanced Photon Source, 20:6420 (R;US)
CERCA is changing its shareholding, 20:5814 (RA;US)
Characterization of atomized U_3Si_2 powder for research reactor, 20:5835 (RA;US)
Characterization of commercially pure aluminum powder for research reactor fuel plates, 20:5816 (RA;US)
Chilean fuel elements fabrication progress report, 20:5857 (RA;US)
Comparison of glassy slag waste forms produced in laboratory crucibles and in a bench-scale plasma furnace, 20:5130 (R;US)
Completion of the OSURR fuel conversion and power upgrade, 20:5839 (RA;US)
Continued conversion of the R2 reactor to LEU fuel, 20:5837 (RA;US)
Core conversion of IAN-R1 reactor, 20:5853 (RA;US)
Design of high heat load white-beam slits for wiggler/undulator beamlines at the Advanced Photon Source, 20:6419 (R;US)
Development of a small-channel nucleate-boiling heat transfer correlation, 20:6334 (R;US)
Development of higher density fuel at CERCA, 20:5833 (RA;US)
Direct containing heating experiments in Zion Nuclear Power Plant Geometry using prototypic core materials, the U1A and U1B tests, 20:5753 (R;US)
Direct containment heating experiments in Zion Nuclear Power Plant Geometry using prototypic core materials, the U2 test, 20:5754 (R;US)
Dose analysis in safety and site evaluation for the JMTR core conversion of LEU fuel, 20:5876 (RA;US)
Early detection of coolant boiling in research reactors with MTR-type fuel, 20:5877 (RA;US)
Energy efficiency of electric vehicles at the 1994 American Tour de Sol, 20:6144 (R;US)
Epi-thermal neutron spectra from low and high enrichement uranium fuels at the Georgia Tech Research Reactor for Boron Neutron Capture Therapy, 20:5856 (RA;US)
Explosive bonding and its application in the Advanced Photon Source front-end and beamline components design, 20:6423 (R;US)
External research reactor fuel cycle: Back-end options, 20:5845 (RA;US)
GPS. General Purpose Simulation, 20:7032 (CM;US)
Greek research reactor performance characteristics after addition of beryllium reflector and LEU fuel, 20:5855 (RA;US)
HEU and LEU MTR fuel elements as target materials for the production of fission molybdenum, 20:6295 (RA;US)
HEU-LEU conversion of non-power reactors licensed by the Nuclear Regulatory Commission, 20:5836 (RA;US)
High Energy Physics Division semiannual report of research activities, January 1, 1994–June 30, 1994, 20:6710 (R;US)
Initial building investigations at Aberdeen Proving Ground, Maryland: Objectives and methodology, 20:5382 (R;US)

F

Fachhochschule Hannover (Germany). Fachbereich Elektrotechnik
Performance of a photovoltaic solar cell generator for active power and reactive power input into power suply grids. Final report, 20:5564 (I;DE;In German)

Fachhochschule Luebeck (Germany). Fachbereich Angewandte Naturwissenschaften
Extension of the actively solar heated single-family house at the Luebeck Polytechnic since 1982 for demonstration purposes by passive components and simultaneous increase of living comfort. Final report, 20:6098 (R;DE;In German)

Feldmuehle AG, Plochingen (Germany)
Soldering ceramics to metals. Development of solders and soldering methods. Final report, 20:6245 (I;DE;In German)

Fermi National Accelerator Lab., Batavia, IL (United States)
A high speed digitizing photomultiplier tube base for the KTeV CsI calorimeter, 20:6445 (R;US)
A longitudinal bunch monitoring system using LabVIEW® and high-speed oscilloscopes, 20:6388 (R;US)
A measurement of the mass of the W vector boson at CDF, 20:6753 (R;US)
A search for $t\bar{t} \rightarrow$ lepton + E_T + jets signature in $p\bar{p}$ collisions at $\sqrt{s}$ = 1.8 TeV with the D0 detector, 20:6731 (R;US)
A study of events with large total transverse energy produced in proton-antiproton collisions at $\sqrt{s}$ = 1.8 TeV, 20:6734 (R;US)
Charged particle beam current monitoring tutorial, 20:6386 (R;US)
Dv upgrade muon electronics design, 20:6444 (R;US)
Double-sided silicon microstrip sensors for the CDF SVX II detector, 20:6446 (R;US)
Electron drift velocities of Ar-CO_2-CF_4 gas mixtures, 20:6387 (R;US)
Electroweak boson pair production at the Tevatron, 20:6732 (R;US)
Evidence for top quark production in 1.8 TeV $p\bar{p}$ collisions, 20:6756 (R;US)
Fermilab Tevatron and upgrade status, 20:6369 (R;US)
Introduction to colliding beams at Fermilab, 20:6371 (R;US)
Measurement of correlated b quark cross sections at CDF, 20:6754 (R;US)
Measurement of the WWγ, ZZγ and Z$\gamma\gamma$ couplings at the Fermilab Tevatron, 20:6733 (R;US)
Neutrino optics, 20:6380 (R;US)
Operation and performance of the silicon vertex detector (SVX') at CDF, 20:6443 (R;US)
Operation and tests of a DDC101 A/D, 20:6450 (R;US)
Performance of a large scale scintillating fiber tracker using VLPC readout, 20:6440 (R;US)
Procedure to determine the two channel timing measurement accuracy and precision of a digital oscilloscope, 20:6389 (R;US)
Proceedings of the workshop on future hadron facilities in the US, 20:6370 (R;US)
Radioisotope electric propulsion for robotic science missions to near-interstellar space, 20:5506 (R;US)
Recent results from Fermilab E-687, charm particle decays, lifetimes and photoproduction dynamics: A compilation results presented at DPF 1994, 20:6735 (R;US)
Search for new gauge bosons at Dv, 20:6730 (R;US)
Search for supersymmetry and leptoquark states at FNAL, 20:6755 (R;US)
Search for top quark at CDF, 20:6736 (R;US)
Standardization of CDF and Dv reported luminosities, 20:6449 (R;US)
The CDF silicon vertex detector SVX and its upgrades, 20:6447 (R;US)
The D0 Silicon Tracker: A completely redesigned vertex detector, 20:6442 (R;US)
The KTeV PMT laser monitoring system, 20:6448 (R;US)
VLPC characterization for the Dzero upgrade, 20:6441 (R;US)
W mass measurements from D$\emptyset$ and CDF experiments at TeVatron, 20:6752 (R;US)

Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)
Uranium soils integrated demonstration: Soil characterization project report, 20:5417 (R;US)

Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project
Decontamination and dismantlement of Plant 7 at Fernald, 20:5415 (R;US)
Development of subcontractor indirect cost and other direct cost at the DOE Fernald Site, 20:5416 (R;US)
Feasibility study report for Operable Unit 4: Volume 1, 20:5398 (R;US)
Feasibility study report for Operable Unit 4: Volume 2, 20:5399 (R;US)
Feasibility study report for Operable Unit 4: Volume 4, 20:5401 (R;US)
Identifying environmental safety and health requirements for the Fernald Environmental Restoration Management Corporation, 20:5413 (R;US)

Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland)
Operation of Finnish nuclear power plants. Quarterly report 1st quarter, 1994, 20:5720 (R;FI)
Radiation meters for civil defence, 20:6617 (R;FI)
The radioactivity of construction materials, fuel peat and peat ash, 20:6618 (R;FI)

Florida Univ., Gainesville, FL (United States). Dept. of Physics
A quantum gravitational mechanism for exiting inflation, 20:6650 (R;US)

FLS Miljoe A/S, Valby (Denmark)
Hot gas cleaning, 20:4907 (R;DK;In Danish, English)

Fluor Daniel Environmental Restoration Management Corp., Fernald, OH (United States)
Ensuring comparability of data generated by multiple analytical laboratories for environmental decision making at the Fernald Environmental Management Project, 20:5414 (R;US)
Uranium soils integrated demonstration: Soil characterization project report, 20:5417 (R;US)

Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik
Investigations into the recycling or the dumping of coal ash and flue gas purification residues, 20:4944 (R;DE;In German)
Research project MAW and HTR fuel element test storage in boreholes (MHV project). Emplacement and borehole sealing techniques (EBT part-project). Final report on project phase October 1, 1989 - December 31, 1992, 20:5169 (R;DE;In German)
Selenium release from iodine filters in the event of brine ingress into a repository, 20:5170 (R;DE;In German)

Forschungszentrum Juelich GmbH (Germany). Projektleitung Biologie, Oekologie, Energie
Noble metal emissions. Interim report, 20:6626 (I;DE;In German)

Foster Wheeler Development Corp., Livingston, NJ (United States)
The analysis and specification of large high-pressure, high-temperature valves for combustion turbine protection in second-generation PFB power plants: Topical report, 20:5659 (R;US)

Foster-Wheeler Environmental Corp., Oak Ridge, TN (United States)
Removal action work plan for Corehole 8 in Waste Area Grouping 1 at Oak Ridge National Laboratory, Oak Ridge, Tennessee, 20:5425 (R;US)

Fraunhofer-Institut fuer Solare Energiesysteme (ISE), Freiburg im Breisgau (Germany)
Production and characterization of optical components for active and passive solar thermal applications. Final report, 20:5581 (R;DE;In German)

Freie Univ. Berlin (Germany). Forschungsstelle fuer Umweltpolitik
Energy policy in Thailand. On the prospects of energy efficiency strategies in a threshold country, 20:5978 (R;DE;In German)

G

General Accounting Office, Washington, DC (United States). Resources, Community and Economic Development Div.
Progress toward international agreement to improve reactor safety, 20:5738 (R;US)

General Atomics, San Diego, CA (United States)
4 MW fast wave current drive upgrade for DIII-D, 20:6896 (R;US)
A vacuum window for a 1 MW CW 110 GHz gyrotron, 20:6895 (R;US)
DIII-D program overview, 20:6900 (R;US)
Divertor research on the DIII-D tokamak, 20:6901 (R;US)
Engineering and design of a CO_2 phase contrast interferometer system for DIII-D, 20:6871 (R;US)
Experimental achievement of toroidal beta beyond that predicted by "Troyon" scaling, 20:6899 (R;US)
Experimental aspects of effects of high-energy particles on Alfven modes, 20:6870 (R;US)
FSV experience in support of the GT-MHR reactor physics, fuel performance, and graphite, 20:5729 (R;US)
GT-MHR design, performance, and safety, 20:5728 (R;US)
GT-MHR operations and control, 20:5727 (R;US)
GT-MHR power conversion system: Design status and technical issues, 20:5726 (R;US)
Helium-cooling in fusion power plants, 20:6897 (R;US)
q Profile evolution and enhanced core confinement of high β_p plasmas in DIII-D, 20:6869 (R;US)
The role of shaping in achieving high performance in DIII-D, 20:6898 (R;US)
TRAMP. Transport of Metallic Fission Products Along Multiple Parallel Paths, 20:7022 (CM;US)
Transport simulation of negative magnetic shear discharges, 20:6872 (R;US)
UEDGE and DEGAS modeling of the DIII-D scrape-off layer plasma, 20:6938 (R;US)

General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation
Calculations of the surface heat flux and fuel temperatures for PRTR MK-I PuO_2-UO_2 fuel element with segregated PuO_2, 20:5869 (R;US)
Hot semiworks Redox studies, 20:5088 (R;US)

Notes on heat transfer from rotating machinery components to gases, 20:5730 (R;US)
Problems contributing to reduced neptunium shipments FY-1963, 20:5090 (R;US)
Routine 107 basin inlet samples, 20:5164 (R;US)
Surge suppressors for the PRTR process tube flow meters, 20:5817 (R;US)
Transient thermal-hydraulic experiments: N-Reactor inlet connector break, 20:5886 (R;US)

Geological Survey, Carson City, NV (United States)
Meteorological data for four sites at surface-disruption features in Yucca Flat, Nevada Test Site, Nye County, Nevada, 1985–1986, 20:5369 (R;US)

Geological Survey, Denver, CO (United States)
Gravity and magnetic data of Midway Valley, southwest Nevada, 20:5218 (R;US)
Gravity and magnetic study of Yucca Wash, southwest Nevada, 20:5219 (R;US)
Preliminary hydrogeologic assessment of boreholes UE-25c No. 1, UE-25c No. 2, and UE-25c No. 3, Yucca Mountain, Nye County, Nevada, 20:5220 (R;US)

George Washington Univ., Washington, DC (United States). Center for Nuclear Studies
Investigations of the structure and electromagnetic interactions of few-body systems. Progress report, 1 July 1991–30 June 1994, 20:6760 (R;US)

Georgia Univ., Athens, GA (United States). Center for Computational Quantum Chemistry
Potential energy surfaces for chemical reactions. Progress report, March 15, 1988–1989, 20:6282 (R;US)

Georgia Univ., Athens, GA (United States). Complex Carbohydrate Research Center
Structural studies of complex carbohydrates of plant cell walls. Final report, December 15, 1989–June 14, 1993, 20:6585 (R;US)

Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany)
Reports on research programs in the field of reactor safety sponsored by the Federal Minister of Research and Technology. Reported period: July 1 to December 31, 1993, 20:5884 (R;DE;In German)
Safety analysis of BWR-type reactors. Summarizing report, 20:5883 (R;DE;In German)

Gesellschaft fuer Organisation, Planung und Ausbildung mbH (GOPA), Bad Homburg (Germany)
Prospects: 25 years GOPA 1990, 20:6065 (I;DE;In German)
Rational use of energy in the area of electricity, 20:6033 (IA;DE;In German)
Use of renewable energy sources in developing countries. The energy-economical situation in rural areas, 20:6068 (IA;DE;In German)

Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany)
List of reports in the field of reactor safety research from BMFT, CEA, EPRI, JSTA and USNRC. Reported period: January 1 to June 30, 1994, 20:5885 (I;DE;In German)

Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)
Doppler-shift assisted fast ion spectroscopy: a case study for X-ray emission from 277 MeV/u Pb^{81+} ions, 20:6813 (R;DE)
Prompt photon production in p-p collisions, 20:6737 (R;DE)

Gesellschaft fuer Strahlen- und Umweltforschung mbH Muenchen (GSF), Neuherberg (Germany). Projekttraeger Umwelt- und Klimaforschung
Noble metal emissions. Interim report, 20:6626 (I;DE;In German)

GKSS-Forschungszentrum Geesthacht GmbH (Germnay)
Mapping of pollutants in sediments of the German Wadden Sea - June, 1989 to June, 1992. Final report January 1993, 20:6551 (R;DE;In German)

Glowny Inst. Gornictwa, Katowice (Poland)
Nuclear track membranes in devices for air cleaning personnel viability support and biotechnological protection, 20:5491 (IA;PL)
Some properties of irradiated Estrofol foil, 20:6829 (IA;PL)
The application of particle track membranes in dactyloscopy, 20:5492 (IA;PL)

Grambling State Univ., LA (United States). Dept. of Chemistry
Rheological properties essential for the atomization of coal water slurries (CWS). Quarterly progress report, June 15, 1994–September 1994, 20:4985 (R;US)

GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Braunschweig (Germany). Inst. fuer Tieflagerung
Radiation effects in rock salt. A status report, 20:5166 (R;DE)

GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU)
Air pollutants and human health. Literature documentation. As of March 1993, 20:6628 (R;DE;In German)

Changes of and prospects for energy supply and demand in the Asia-Pacific region, 20:6035 (IA;JP;In Japanese)
Coal and related issues, 20:6046 (IA;JP;In Japanese)
Economic development in Asia and subjects to be met, 20:5973 (IA;JP;In Japanese)
Electric utility business and related issues in Japan, 20:6054 (IA;JP;In Japanese)
Foreign countries' investment to and technical cooperation with Russia, 20:5981 (IA;JP;In Japanese)
Global environmental issues, 20:5989 (IA;JP;In Japanese)
Investigation on influences of large-scale power service interruption n life and economy in the Tokyo metropolitan region, 20:6087 (I;JP;In Japanese)
Keynote report by special guest, 20:5972 (IA;JP;In Japanese)
Latest situation around natural gas in Japan, 20:5072 (IA;JP;In Japanese)
Natural gas (U.S. outlook), 20:5073 (IA;JP;In Japanese)
Oil and related issues. U.S. outlook, 20:5015 (IA;JP;In Japanese)
Outlook for U.S. coal and related issues, 20:6045 (IA;JP;In Japanese)
Overview of the U.S. electric industry, 20:6055 (IA;JP;In Japanese)
Presentation on the World Energy Efficiency Association, 20:6032 (IA;JP;In Japanese)
Problem of global environment and improvement of energy efficiency, 20:5980 (IA;JP;In Japanese)
Research on feasibility of utilization of spent vegetable oils as substitutes for petroleum derived oils, 20:6118 (R;JP;In Japanese)
Trend of on-site power generation in the manufacturing industry, 20:6130 (R;JP;In Japanese)
U.S.-Japan Energy Conference/Maui Meeting, 20:5971 (I;JP;In Japanese)
U.S.-Japan Energy Consultation, Maui Meeting. Petroleum and related issues, 20:6047 (IA;JP;In Japanese)

Institute of Gas Technology, Chicago, IL (United States)
Advanced staged combustion system for power generation, 20:5650 (R;US)
Characterization of carbon-sulfur bond cleavage by axenic and mixed cultures of Rhodococcus rhodochrous IGTS8, 20:4888 (R;US)
Current status of the IGT RENUGAS® process, 20:5532 (R;US)
Development of the IGT RENUGAS® process, 20:5533 (R;US)
Fuel composition effects on natural gas vehicle emissions, 20:6149 (R;US)
Gasoline from natural gas by sulfur processing. Quarterly report No. 4, April 1994–June 1994, 20:5544 (R;US)
Scaleup of IGT MILDGAS Process to a process development unit, 20:4889 (R;US)

Institute of Nuclear Chemistry and Technology, Warsaw (Poland)
Chubu pilot plant test, 20:5496 (IA;PL)
Continuous, multichannel monitoring and control system for industrial flue gas treatment by electron beam. Methods and systems

of flue gas preparation for further analysis and monitoring, 20:5504 (IA;PL)
Development of electron beam induced off gas cleaning at the Kernforschungszentrum Karlsruhe, 20:5498 (IA;PL)
Development of the next generation of powerful electron accelerators, 20:6372 (IA;PL)
Economics of the electron beam process, 20:5508 (IA;PL)
Energization of pulse corona induced chemical processes, 20:5499 (IA;PL)
Flue gas irradiation effectiveness and dosimetry results of 20,000 Nm^3 pilot plant, 20:5503 (IA;PL)
High power accelerators for flue gas treatment, 20:5495 (IA;PL)
IAEA final research co-ordination meeting on radiation processing of combustion flue gases. Poland, Zakopane, 24-28 May, 1993. Pts. 1-3, 20:5493 (I;PL)
Introduction and historical review of electron beam processing for environmental pollution control, 20:5494 (IA;PL)
Investigation of SO_2 oxidation in humid air stream by high current density pulsed electron beam, 20:6292 (IA;PL)
Measurements of nitrous oxide concentration, 20:5502 (IA;PL)
Multivariate calibration and quantitation using artificial neutral networks, 20:6270 (IA;PL)
Nitrogen oxide decomposition by means of electron impact, 20:5501 (IA;PL)
Nuclear track membranes in devices for air cleaning personnel viability support and biotechnological protection, 20:5491 (IA;PL)
Overview of Nissin high voltage's e-beam technologies, 20:6373 (IA;PL)
Pilot-scale tests for EB flue gas treatment process in Japan, 20:5497 (IA;PL)
Preparation of high purity boron for doping silicon used for manufacturing of integrated circuits, 20:6246 (IA;PL)
Project of linear induction accelerator with 500 kW average beam power for flue gas cleanup, 20:5505 (IA;PL)
Radiation induced scavenging of NO_x, SO_2, H_2S from exhaust gases, 20:6290 (IA;PL)
Recent results from Polish pilot plant operation, 20:5500 (IA;PL)
Some properties of irradiated Estrofol foil, 20:6829 (IA;PL)
The application of particle track membranes in dactyloscopy, 20:5492 (IA;PL)
The effect of clusters and heterogeneous reactions on non-equilibrium plasma flue gas cleaning, 20:6291 (IA;PL)

Institute of Nuclear Physics, Cracow (Poland)
Radiological hazard from coal-fired power plants in Poland, 20:6606 (R;PL;In Polish)

International Atomic Energy Agency, Vienna (Austria)
Chubu pilot plant test, 20:5496 (IA;PL)
Continuous, multichannel monitoring and control system for industrial flue gas treatment by electron beam. Methods and systems of flue gas preparation for further analysis and monitoring, 20:5504 (IA;PL)
Development of electron beam induced off gas cleaning at the Kernforschungszentrum Karlsruhe, 20:5498 (IA;PL)
Development of the next generation of powerful electron accelerators, 20:6372 (IA;PL)
Economics of the electron beam process, 20:5508 (IA;PL)
Energization of pulse corona induced chemical processes, 20:5499 (IA;PL)
Flue gas irradiation effectiveness and dosimetry results of 20,000 Nm^3 pilot plant, 20:5503 (IA;PL)
High power accelerators for flue gas treatment, 20:5495 (IA;PL)
IAEA final research co-ordination meeting on radiation processing of combustion flue gases. Poland, Zakopane, 24-28 May, 1993. Pts. 1-3, 20:5493 (I;PL)

Jacobs Engineering Group, Inc., Albuquerque, NM (United States)
Annual report on the U.S. Department of Energy's Cultural Resource Activities at Colorado UMTRA Project Sites for October 1993 through September 1994, 20:5140 (R;US)
Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Site near Green River, Utah, 20:5388 (R;US)
Baseline risk assessment of ground water contamination at the uranium mill tailings site Salt Lake City, Utah, 20:5355 (R;US)
Baseline risk assessment of ground water contamination at the uranium mill tailings sites near Slick Rock, Colorado, 20:5356 (R;US)
Baseline risk assessment of ground water contamination at the uranium mill tailings site near Canonsburg, Pennsylvania, 20:5357 (R;US)
Baseline risk assessment of ground water contamination at the inactive uraniferous lignite ashing site near Bowman, North Dakota, 20:5358 (R;US)
Baseline risk assessment of ground water contamination at the uranium mill tailings site near Falls City, Texas: Revision 1, 20:5354 (R;US)
Comment and response document for the long-term surveillance plan and the completion report for the Lowman, Idaho, disposal site, 20:5143 (R;US)
Economic impact study of the Uranium Mill Tailings Remedial Action Project in Colorado: Colorado state fiscal year 1994, 20:5393 (R;US)
Environmental assessment of remedial action at the Maybell uranium mill tailings site near Maybell, Colorado: Revision 2, 20:5395 (R;US)
Environmental assessment of remedial action at the Naturita uranium processing site near Naturita, Colorado: Revision 5, 20:5396 (R;US)
Final report of the UMTRA independent technical review of TAC audit programs, 20:5141 (R;US)
Finding of No Significant Impact, proposed remediation of the Maybell Uranium Mill Processing Site, Maybell, Colorado, 20:5394 (R;US)
Human health risk assessment methodology for the UMTRA Ground Water Project, 20:5392 (R;US)

Proposed ground water protection strategy for the Uranium Mill Tailings Site at Green River, Utah. Final report, 20:5391 (R;US)
Site observational work plan for the UMTRA Project site at Ambrosia Lake, New Mexico, 20:5390 (R;US)
UMTRA Project Administrative Files Collection Records Management Program, 20:5142 (R;US)
UMTRA Project Office quality assurance program plan. Revision 6, 20:5137 (R;US)
UMTRA Project Site Observational Work Plan, Mexican Hat, Utah, 20:5139 (R;US)
UMTRA Project water sampling and analysis plan, Gunnison, Colorado: Revision 1, 20:5389 (R;US)
UMTRA technical assistance contractor quality assurance program plan, 20:5136 (R;US)
Uranium Mill Tailings Remedial Action Project 1993 Environmental Report, 20:5138 (R;US)
Uranium Mill Tailings Remedial Action Project Safety Advancement Field Effort (SAFE) Program, 20:5386 (R;US)
Uranium Mill Tailings Remedial Action Project environmental protection implementation plan, 20:5387 (R;US)

Japan Atomic Energy Research Inst., Tokyo (Japan)
An index database of Charged-Particle Nuclear Reaction Data, 20:7055 (RA;JP)
Applications of error covariance to fast reactor material dosimetry in JOYO, 20:5818 (RA;JP)
Atomic, molecule's and nuclear data for medical application, 20:6591 (RA;JP)
Benchmark problems for intermediate and high energy accelerator shielding, 20:6390 (R;JP)
Calculation of thermal deformations in water-cooled monochromator crystals, 20:6426 (R;JP;In Japanese)
Critical element development of standard pipe connector for remote handling, 20:6902 (R;JP)
Critical element development of double seal door for tritium containment, 20:6908 (R;JP)
Design concept of a cryogenic distillation column cascade for a ITER scale fusion reactor, 20:6907 (R;JP)
Design study of prototype accelerator and MeV test facility for demonstration of 1 MeV, 1 A negative ion beam production, 20:6905 (R;JP)
Development and trial manufacturing of 1/2-scale partial mock-up of blanket box structure for fusion experimental reactor, 20:6906 (R;JP;In Japanese)
Development of integrated insulation joint for cooling pipe in tokamak reactor, 20:6904 (R;JP)
Development of partitioning method: engineering-scale test on partitioning process. 1. Demonstration of TRU separation by solvent extraction process experimental apparatus, 20:5105 (R;JP;In Japanese)
Environment of nuclear energy development and international cooperation of nuclear data activity, 20:6806 (RA;JP)
Environmental simulation test for radionuclide migration under wet-dry cycle condition in aerated zone, 20:6555 (R;JP;In Japanese)
Evaluation of strength properties of developed SiC/C compositionally gradient graphite materials, 20:6247 (R;JP;In Japanese)
Experience on preparation of a covariance library for the NEUPAC code, 20:6785 (RA;JP)
Experiment and simulation of an electron/positron convertor for SPring-8, 20:6425 (R;JP;In Japanese)
Hydrogen formation in metals and alloys during fusion reactor operation, 20:6909 (R;JP)
In-situ measurement of zircaloy corrosion rate in high temperature, high pressure water, 20:6182 (R;JP;In Japanese)
Irradiation experiments of low copper A533B steels for reactor pressure vessel tested in JMTR, 20:6181 (R;JP)
Irradiation tests of critical components for remote handling in gamma radiation environment, 20:6903 (R;JP)
Low-energy ion-beam deposition apparatus equipped with surface analysis system, 20:6648 (R;JP;In Japanese)
Measurements of thermal neutron cross section and resonance integral for the $^{237}Np(n,\gamma)^{238}Np$ reaction, 20:6783 (RA;JP)
Needs of atomic, molecule's and nuclear data for medical application in Japan, 20:6592 (RA;JP)
Onset of ELMs in JT-60U, 20:6874 (R;JP)
Proceeding of the second steering conference relating to the 'agreement on the Implementation of Research at the Chernobyl Center for International Research' between CHECIR and JAERI, 20:5823 (R;JP;In Japanese, English)
Processing of covariance file and related problems, 20:6784 (RA;JP)
Radionuclide transfer onto ground surface in surface water flow. 2. Undisturbed tuff rock, 20:6556 (R;JP;In Japanese)
Recent nuclear data activities in China related to CENDL-2, 20:6782 (RA;JP)
Reevaluation of FP nuclear data for JENDL-3.2, 20:6807 (RA;JP)
Report of the 1993 workshop on particle-material interactions for fusion, 20:6955 (R;JP;In Japanese, English)
Request of nuclear data file for study of new application of transmutation, 20:5167 (RA;JP)
Safety and sensitivity analyses of a generic geologic disposal system for high-level radioactive waste, 20:5168 (R;JP)
Shielding analysis of the ITER/EDA NBI duct, 20:6910 (R;JP)
Stability analysis of external kink mode for ITER L-mode profile plasmas, 20:6875 (R;JP)
Study of nuclear data in Indonesia, 20:6805 (RA;JP)
Transport studies of tokamak plasmas in JT-60 device, 20:6873 (R;JP)
Utilization of cross-section covariance data in FBR core nuclear design and cross-section adjustment, 20:5734 (RA;JP)

Industrial and structural policy for the North-Rhine Westphalia area, 20:5977 (I;DE;In German)
Wind power plants in North-Rhine Westphalia: Wind power generation in the dyked land of Northwestern Germany. Report on results, 20:5636 (R;DE;In German)

Ministry of Trade and Industry, Helsinki (Finland). Energy Dept.
Report on the spent fuel management of the Loviisa nuclear power plant, 20:5172 (R;FI;In Finnish)

Mississippi State Univ., MS (United States). Forest Products Lab.
Develop apparatus and process for second-stage drying. Quarterly progress report, September 26–December 26, 1994, 20:6112 (R;US)

Missouri Univ., Columbia, MO (United States). Capsule Pipeline Research Center
Capsule Pipeline Research Center. 3-year Progress report, September 1, 1993–August 31, 1994, 20:4958 (R;US)

Missouri Univ., Rolla, MO (United States)
Processing of $LaCrO_3$ for solid oxide fuel cell applications, 20:6079 (R;US)

Mitsubishi Research Inst., Inc., Tokyo (Japan)
Preparatory research for global warming precaution spread promotion manual and early spread plan research work. Photovoltaic power generation spread plan research report, 20:5998 (I;JP;In Japanese)

Montana State Univ., Bozeman, MT (United States). Dept. of Physics
NMR and optical studies of piezoelectric polymers. Final performance report, April 1, 1993–March 31, 1994, 20:6289 (R;US)

Montgomery Watson, Richland, WA (United States)
Conceptual design report, Hazardous Materials Management and Emergency Response (HAMMER) Training Center, 20:5447 (R;US)

Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki
A new technique for analyzing crystal structures by electron channeling image processing, 20:6839 (IA;RU;In Russian)
A set of programs describing electromagnetic processes at relativistic particle motion in the periodic potential of crystal field, 20:6843 (IA;RU;In Russian)
Accumulation of radiation defects in silicon at high-energy ion implantation, 20:6847 (IA;RU;In Russian)
Accurate measurement of oxigen profule in oxide films using resonance in helium ion elastic scattering at the energy of 3,045 MeV, 20:6823 (IA;RU;In Russian)
Acoustic analysis of the efficiency of beam deflection by a bended crystal, 20:6835 (IA;RU;In Russian)
Anomalous peculiarities and positron-like channeling of relativistic electron in magnetic crystals, 20:6834 (IA;RU;In Russian)
Antiproton channeling, 20:6836 (IA;RU;In Russian)
Calculation of ion depth distribution at axial channeling with the allowance for multiple scattering and energy loss fluctuations, 20:6841 (IA;RU;In Russian)
Calculation of radiation and pair production probabilities at arbitrary incidence angles to crystal planes, 20:6803 (IA;RU;In Russian)
Changes in electrophysical properties of silicon at multistep ion implantation, 20:6840 (IA;RU;In Russian)
Coherent excitation of Ne^{9+} ion in Au crystal. Computerized simulation, 20:6832 (IA;RU;In Russian)
Coherent photoproduction of a relativistic positronium atom, 20:6818 (IA;RU;In Russian)
Comparison of characteristics of coherent radiations from crystals and periodic radiators, 20:6801 (IA;RU;In Russian)
Comparison of diffraction intensity of bremsstrahlung photons and parametric X-radiation, 20:6804 (IA;RU;In Russian)
Coulomb excitation of nuclei in crystals by protons and antiprotons, 20:6833 (IA;RU;In Russian)
Crystal structure of multilayered HTSC films investigated by the method of mean energy ion scattering, 20:6825 (IA;RU;In Russian)
Defect formation in silicon irradiated by high-energy argon ions, 20:6848 (IA;RU;In Russian)
Determination of a deformation profile in alpha-irradiated lead chalcogenide films, 20:6821 (IA;RU;In Russian)
Diffusion of boron implanted into silicon irradiated by high-energy argon ions, 20:6846 (IA;RU;In Russian)
Distortions in B-type coherent bremsstrahlung spectra of channeling relativistic electrons, 20:6844 (IA;RU;In Russian)
Electron channeling and electron microscopy of atomic resolution, 20:6831 (IA;RU;In Russian)
Energy dependence of the intensity of backscattering of fast electrons by highly symmetric crystals, 20:6838 (IA;RU;In Russian)
Estimation of the degree of authenticity of concentrational element profile derived from RBS measurements, 20:6827 (IA;RU;In Russian)
Evaluation of the Bragg law fluctuation at the calculation of proton slowing-down in SiO_2, 20:6798 (IA;RU;In Russian)
Fluctuations of polarization fields, 20:6799 (IA;RU;In Russian)
Influence of ion flux density and irradiation time on the long-range interaction effect, 20:6849 (IA;RU;In Russian)
Interaction of oxygen ions with the crystal lattice of Si-detector at channeling, 20:6837 (IA;RU;In Russian)
Internuclear axis orientation effects at molecular ion dissociation in metal surface, 20:6855 (IA;RU;In Russian)

Li impurity atom position in $Nd_2CuO_{4-\delta}$ crystal lattice, 20:6822 (IA;RU;In Russian)
Nuclear physics methods of the determination of oxygen content in materials, 20:6824 (IA;RU;In Russian)
On the possibility of one-frequency quasicharacteristic radiation generation at coherent channeling in crystals, 20:6842 (IA;RU;In Russian)
Oxygen position in silicon, 20:6852 (IA;RU;In Russian)
Photoproduction of a hypothetic neutral particle in oriented monocrystal, 20:6757 (IA;RU;In Russian)
Proceedings of 22. international meeting on the physics of interaction of charged particles with crystals, 20:6830 (I;RU;In Russian)
Radiation defects and thermal stability of $A^{IV}B^{VI}$ films at proton irradiation, 20:6854 (IA;RU;In Russian)
Radiation-acoustic study of a superconducting state in $YBa_2Cu_3O_7$, 20:6860 (IA;RU;In Russian)
Reconstruction of impurity concentration profile by the resonance nuclear reaction method, 20:6826 (IA;RU;In Russian)
Stopping power of solid absorbers for nitrogen and carbon ions in the range of maximum stopping power curve, 20:6800 (IA;RU;In Russian)
Structural changes in GaAs doped with selenium ions, 20:6850 (IA;RU;In Russian)
Study of coherent pair production of B type in silicon crystal, 20:6802 (IA;RU;In Russian)
Study of positron beam production at electron channeling in tungsten, 20:6845 (IA;RU;In Russian)
The effect of low-energy oxygen ions on structural perfection of monocrystalline films of yttrium ferrite-garnets, 20:6820 (IA;RU;In Russian)
The effect of size-energy factor on mass transfer at ion implantation of two-layer films, 20:6851 (IA;RU;In Russian)
The influence of defect thermal stability on ion-induced crystallization, 20:6853 (IA;RU;In Russian)

MSE, Inc., Butte, MT (United States)
Comparison of glassy slag waste forms produced in laboratory crucibles and in a bench-scale plasma furnace, 20:5130 (R;US)
Projects at the Component Development and Integration Facility. Quarterly technical progress report, July 1–September 30, 1994, 20:6074 (R;US)

Survey of industry methods for producing highly reliable software, 20:5958 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications
Control of water infiltration into near surface LLW disposal units. Progress report on field experiments at a humid region site, Beltsville, Maryland: Volume 7, 20:5188 (R;US)
Geochemical investigations related to the Yucca Mountain environment and potential nuclear waste repository, 20:5189 (R;US)
Occupational radiation exposure at commercial nuclear power reactors and other facilities, 1993. Volume 15, Twenty-six annual report, 20:5892 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution
Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Analysis of core damage frequency from internal events during mid-loop operations, Appendices E (Sections E.1–E.8). Volume 2, Part 3A, 20:5954 (R;US)
Systems Analysis Programs for Hands-on Integrated Reliability Evaluations (SAPHIRE), Version 5.0: Integrated Reliability and Risk Analysis System (IRRAS) tutorial manual. Volume 3, 20:5953 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research
Applicability of object-oriented design methods and C++ to safety-critical systems, 20:5938 (RA;US)
Application of workshop to NRC activities, 20:5947 (RA;US)
Automated tools for safety-critical software, 20:5939 (RA;US)
Certification of software for reuse in safety-critical applications, 20:5946 (RA;US)
Experiences from application of digital systems in nuclear power plants, 20:5931 (RA;US)
Fault-specific verification (FSV) - An alternative VV&T strategy for high reliability nuclear software systems, 20:5945 (RA;US)
Hardware aspects of safety critical digital computer based instrumentation and control systems, 20:5932 (RA;US)
How much software verification and validation is adequate for nuclear safety?, 20:5944 (RA;US)
Human aspects for safety-critical systems, 20:5934 (RA;US)
Hydrogen Mixing Studies (HMS), user's manual, 20:5955 (R;US)
Industry perspective on digital upgrades: A utility perspective on digital upgrades, 20:5821 (RA;US)
Integrated modeling of software cost and quality, 20:5941 (RA;US)
Interaction between systems and software engineering in safety-critical systems, 20:5935 (RA;US)
NRC closing remarks, 20:5949 (RA;US)
NRC Research activities, 20:5930 (RA;US)
NUSMG Presentation: Nuclear utilities software management group, 20:5948 (RA;US)
Presentation on NRC Regulatory Positions and guidelines, 20:5749 (RA;US)
Software aspects for safety-critical systems, 20:5933 (RA;US)
Software configuration management for safety-critical systems, 20:5943 (RA;US)
Software reliability for safety-critical applications, 20:5942 (RA;US)
Specification-based testing: What is it? How can it be automated?, 20:5937 (RA;US)

The impact of environmental conditions on human performance: A critical review of the literature. Volume 2, 20:6631 (R;US)
The risks of safety-critical systems, 20:5940 (RA;US)
The role of formal specifications, 20:5936 (RA;US)
Welcome and ACRS perspective, 20:5929 (RA;US)
Welcome and opening statement, 20:5928 (RA;US)
Welcome: Commissioner Kenneth C. Rogers, 20:5927 (RA;US)

Nuclear Regulatory Commission, Washington, DC (United States). Div. of Technical Support
Dose commitments due to radioactive releases from nuclear power plant sites in 1990: Volume 12, 20:5827 (R;US)
Licensee contractor and vendor inspection status report. Quarterly report, July–September 1994: Volume 18, No. 3, 20:5739 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data
Office for Analysis and Evaluation of Operational Data 1993 annual report: Volume 8, Number 1, 20:5893 (R;US)
RASCAL Version 2.1 workbook. Volume 2, Revision 2, 20:5420 (R;US)
RASCAL Version 2.1, user's guide, 20:5951 (R;US)
Report to Congress on abnormal occurrences: January–March 1994. Volume 17, No. 1, 20:5891 (R;US)
Report to Congress on abnormal occurrences, April–June 1994: Volume 17, Number 2, 20:6613 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement
Enforcement actions: Significant actions resolved, reactor licensees. Quarterly progress report, July–September 1994; Volume 13, Number 3, Part 1, 20:5745 (R;US)
Enforcement actions: Significant actions resolved, medical licensees. Quarterly progress report, July–September 1994: Volume 13, Number 3, Part 2, 20:6614 (R;US)
Enforcement actions: Significant actions resolved, material licensees (non-medical). Quarterly progress report, July–September 1994: Volume 13, Number 3, Part 3, 20:5746 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Inspection and Enforcement
On-site inspection procedures for SNM doorway monitors, 20:5475 (R;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation
Acoustic emission testing of piston check valves, 20:5725 (RA;US)
Advanced reactor pump and valve issues, 20:5807 (RA;US)
Allowable stem nut wear and diagnostic monitoring for MOVs, 20:5763 (RA;US)
Alternative method of inservice hydraulic testing of difficult to test pumps, 20:5779 (RA;US)
An overview of valve and pump testing regulator issues. Status of generic letter 89-10, future for rulemaking-10 CFR 50.55a, application of probabilistic risk assessment to testing requirements, inservice testing, and advanced reactors, 20:5759 (RA;US)
Applying reliability centered maintenance analysis principles to in-service testing, 20:5789 (RA;US)
Applying risk-based methods to inservice testing, 20:5793 (RA;US)
Argo packing friction research update, 20:5781 (RA;US)
Butterfly valve torque prediction methodology, 20:5774 (RA;US)
Cooperation-the key to solving tough valve problems, 20:5787 (RA;US)
Description of comprehensive pump test change to ASME OM code, subsection ISTB, 20:5780 (RA;US)
Dynamic testing of POSI-SEAL motor-operated butterfly valves using strain gages, 20:5797 (RA;US)
Effects of dynamic loading of motor-operated valve actuators, 20:5776 (RA;US)
Efforts by the nuclear industry to evaluate check valve failures, 20:5799 (RA;US)
Enhancements to the Idaho National Engineering Laboratory motor-operated valve assessment software, 20:5765 (RA;US)
EPRI flow-loop/in situ test program for motor-operated valves, 20:5772 (RA;US)
EPRI MOV performance prediction program, 20:5771 (RA;US)
Evaluation of the safety benefits and costs of proposed revisions to inservice testing requirements for pumps and valves, 20:5790 (RA;US)
Gate valve performance prediction, 20:5773 (RA;US)
Generic letter 89-10 and resolution of the motor-operated valve issue, 20:5802 (RA;US)
Globe valve performance prediction, 20:5775 (RA;US)
Guidelines for optimizing safety benefits in ensuring the performance of motor-operated valves, 20:5808 (RA;US)
High-energy flow interruption testing of Anchor/Darling Valve Company gate valves, 20:5760 (RA;US)
How to determine an IST program component scope, 20:5767 (RA;US)
Innovative application of probabilistic risk assessment techniques to limit operating and maintenance expenses, 20:5791 (RA;US)
Inservice testing of vertical pumps, 20:5778 (RA;US)
Inservice testing regulatory overview, 20:5804 (RA;US)
Maintenance planning and performance software for valve packing programs at nuclear power stations (ValvePro Version 2.5), 20:5784 (RA;US)
Model testing on inlet chambers of cooling water pumps, 20:5785 (RA;US)
Modeling valve leakage, 20:5810 (RA;US)
Motor-operated valve inspection results, 20:5803 (RA;US)
Nonintrusive stroke timing and diagnostic testing of solenoid-operated valves, 20:5801 (RA;US)
Onsite nitrogen testing of main steam relief valves, 20:5811 (RA;US)
Packing force data correlations, 20:5783 (RA;US)
Performance based testing and maintenance for check valves, 20:5768 (RA;US)
Periodic and postmaintenance testing of motor-operated valves, 20:5798 (RA;US)
Predictable or not predictable? The MOV question, 20:5762 (RA;US)
Preliminary assessment of pump IST effectiveness, 20:5777 (RA;US)
Preliminary assessment of valve IST effectiveness, 20:5766 (RA;US)
Pressure locking and thermal binding gate valves, 20:5806 (RA;US)
Pressure locking of gate valves-French experience and solutions, 20:5724 (RA;US)
Pressurizer safety valves technical requirements, testing, modifications, and experience, 20:5786 (RA;US)
Protection against malevolent use of vehicles at nuclear power plants: Vehicle barrier system siting guidance for blast protection, 20:5956 (R;US)
Protection against malevolent use of vehicles at nuclear power plants, 20:5957 (R;US)
Ranking of risk significant components for the Davis-Besse Component Cooling Water System, 20:5792 (RA;US)
Results of the motor-operated valve engineering and testing program, 20:5764 (RA;US)
Risk-based approach for prioritizing motor-operated valves, 20:5809 (RA;US)
Risk-based maintenance method and applications, 20:5795 (RA;US)
Risk-based ranking of IST components at Seabrook Station, 20:5794 (RA;US)
Safety significance of inadvertent operation of motor-operated valves in nuclear power plants, 20:5796 (RA;US)
Solution to valve failures at Braidwood induced by service water cavitation, 20:5770 (RA;US)
Ten-year rollover of San Onofre inservice testing program for pumps and valves to OM-6 and OM-10, 20:5723 (RA;US)
The current state of inservice testing programs at U.S. Nuclear Power Plants - a regulatory overview, 20:5769 (RA;US)
The stem factor challenge, 20:5761 (RA;US)
Trending check valve condition via acoustic monitoring during operating flow, 20:5812 (RA;US)
Use of motor-operated valve diagnostic systems in Japan, 20:5788 (RA;US)
USNRC and industry's activities to improve the performance of check valves, 20:5805 (RA;US)

Validation of TVA's generic letter 89-10 MOV design methodology, 20:5800 (RA;US)
Valve packing study, 20:5782 (RA;US)
Verifying check valve position with radiography, 20:5716 (RA;US)
Vigilance and reason - The keys to continued credibility, 20:5758 (RA;US)

Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research
A dynamic fail-safe approach to the design of computer-based safety systems, 20:5906 (RA;US)
A review of potential uses for fiber optic sensors in nuclear power plants, with attendant benefits in plant safety and operational efficiency, 20:5904 (RA;US)
Aging management of light water reactor concrete containments, 20:5708 (RA;US)
An assessment of human factors research facilities and capabilities for the US NRC, 20:5910 (RA;US)
An examination of human factors in external beam radiation therapy: Findings and implications, 20:6595 (RA;US)
Assessing functional diversity by program slicing, 20:5899 (RA;US)
Assessment of the potential for HPME during a station blackout in the Surry and Zion PWRS, 20:5916 (RA;US)
Benchmark analyses with RELAP5 for USNRC simulators, 20:5918 (RA;US)
Biaxial loading and shallow-flaw effects on crack-tip constraint and fracture-toughness, 20:5924 (RA;US)
CANDU 3 transient analysis using AECL codes, 20:5897 (RA;US)
Changing emphasis at the NRC's Office of Nuclear Regulatory Research, 20:5894 (RA;US)
Class 1E software verification and validation: Past, present, and future, 20:5901 (RA;US)
Comparison of the effect of paper and computerized procedures on operator error rate and speed of performance, 20:5902 (RA;US)
Core to surge-line energy transport in a severe accident scenario, 20:5915 (RA;US)
Current results for the NRC's short cracks in piping and piping welds research program, 20:5699 (RA;US)
Database and modeling assessments of the CANDU 3, PIUS, ALMR, and MHTGR designs, 20:5898 (RA;US)
Depressurization as an accident management strategy to minimize direct containment heating, 20:5919 (RA;US)
Detection and effects of pump low-flow operation, 20:5704 (RA;US)
Development of an improved methodology for probabilistic seismic hazard analysis, 20:5715 (RA;US)
Engineering the development of optical fiber sensors for adverse environments, 20:5905 (RA;US)
Experiments on a scaled loop, 20:5914 (RA;US)
Experiments to evaluate behavior of containment piping bellows under severe accident conditions, 20:5711 (RA;US)
Fatigue of carbon and low-alloy steels in LWR environments, 20:5701 (RA;US)
Geologically recent near-surface faulting and folding in Giles County, southwest Virginia: New exposures of extensional and apparent reverse faults in alluvial sediments between Pembroke and Pearisburg, 20:5826 (RA;US)
Guidelines for seismic qualification by experience in ALWRs, 20:5712 (RA;US)
Handbook of methods for risk-based analysis of technical specification requirements, 20:5696 (RA;US)
Heavy-section steel irradiation program progress - recent results from Midland low upper-shelf weld studies, 20:5722 (RA;US)
Human error in remote Afterloading Brachytherapy, 20:6596 (RA;US)
Human factors issues in severe accident management: Training for decision-making under stress, 20:5907 (RA;US)
Implications of an HRA framework for quantifying human acts of commission and dependency: Development of a methodology for conducting an integrated HRA/PRA, 20:5911 (RA;US)
Individual plant examination program aspirations and achievements, 20:5695 (RA;US)
Integral testing of relays and circuit breakers, 20:5714 (RA;US)
IPE data base structure and insights, 20:5721 (RA;US)
Irradiation-assisted stress corrosion cracking of materials from commercial BWRs: Role of grain-boundary microchemistry, 20:5700 (RA;US)
Issues arising with the application of optical fiber transmission in class 1E systems in nuclear power plants, 20:5820 (RA;US)
Large-scale seismic test program at Hualien, Taiwan, 20:5713 (RA;US)
Materials engineering branch activities in 1993, 20:5748 (RA;US)
Modeling of irradiation embrittlement and annealing data, 20:5925 (RA;US)
NRC confirmatory safety system testing in support of AP600 design review, 20:5920 (RA;US)
NRC Confirmatory Testing Program for SBWR, 20:5921 (RA;US)
On-line calibration monitoring for instrumentation channels in nuclear power plants, 20:5819 (RA;US)
Organization and management activities in the nuclear power industry, 20:5908 (RA;US)
Overview of AEOD's program for trending reactor operational events, 20:5697 (RA;US)
Peer review of RELAP5/MOD3 documentation, 20:5917 (RA;US)
Phase I aging assessment of nuclear air-treatment system HEPA filters and adsorbers, 20:5706 (RA;US)
Potential human factors research relating to modern technology in nuclear power plants, 20:5909 (RA;US)
Prioritization of motor operated valves based on risk importances, 20:5707 (RA;US)
Probabilistic-based evaluation of design rules for components affected by intersystem LOCAs, 20:5709 (RA;US)
Progress on risk-based inspection guidelines: Application of Surry-1 pilot study to improved inservice inspection plans, 20:5703 (RA;US)
Ramona-4B development for SBWR safety studies, 20:5923 (RA;US)
RELAP5/MOD3 calculations for GIST data, 20:5922 (RA;US)
RELAP5/MOD3 code coupling model, 20:5698 (RA;US)
Reliability of NDE - cast stainless steel, SAFT-UT performance, PISC III program status, and evaluation of computer-based UT/ISI systems, 20:5702 (RA;US)
Results and insights of a level-1 internal event PRA of a PWR during mid-loop operations, 20:5912 (RA;US)
Software reliability assessment, 20:5900 (RA;US)
Strategy of severe accident physical modeling in view of recent requirements to safety analysis, 20:5895 (RA;US)
Structural aging program approach to providing an improved basis for aging management of safety-related concrete structures, 20:5710 (RA;US)
The capabilities and applications of the saphire 5.0 safety assessment software, 20:5913 (RA;US)
Transactions of the twenty-second water reactor safety information meeting, 20:5950 (R;US)
Transient analysis of the PIUS advanced reactor design with the TRAC-PF1/MOD2 code, 20:5896 (RA;US)
Understanding aging in containment cooling systems, 20:5705 (RA;US)
Validation of the use of network modeling of nuclear operator performance, 20:5903 (RA;US)
VVER-440 dosimetry and neutron spectrum benchmark, 20:5926 (RA;US)

On the spectroscopy of Σ^--hypernuclei, 20:6740 (IA;BG)

Strangeness production experiments at SATURNE, 20:6738 (IA;BG)

Superdeformed bands in the A≈130 region, 20:6772 (IA;BG)

Solvis Energiesysteme GmbH, Braunschweig (Germany)

Development of absorbers for flat plate collectors. Final report, 20:5590 (R;DE;In German)

Sorbent Technologies Corp., Twinsburg, OH (United States)

Pilot-scale testing of a new sorbent for combined SO_2/NO_x removal. Final report, 20:5693 (R;US)

South Carolina Univ., Columbia, SC (United States). Dept. of Chemistry

The transformation of organic amines by transition metal cluster compounds: Progress report, 20:6279 (R;US)

South Carolina Univ., Columbia, SC (United States). Dept. of Electrical and Computer Engineering
ARIES: A mobile robot inspector, 20:6306 (R;US)

Southeastern Consortium for Minorities in Engineering, Atlanta, GA (United States)
1993-1994 Final technical report for establishing the SECME Model in the District of Columbia, 20:6642 (R;US)
Establishing the SECME Model in the District of Columbia. Third quarter report, April 1, 1994–June 30, 1994, 20:6641 (R;US)

Southern California Research Corp., San Rafael, CA (United States)
Method for cutting steam heat losses during cyclic steam injection of wells. Third quarterly report, 20:5011 (R;US)

Southern Co. Services, Inc., Birmingham, AL (United States)
Innovative Clean Coal Technology (ICCT): 500 MW demonstration of advanced wall-fired combustion techniques for the reduction of nitrogen oxide (NO_x) emissions from coal-fired boilers. Phase 3A, Low NO_x burner tests, 20:5688 (R;US)

Southwest Research Inst., San Antonio, TX (United States)
Diesel fuel component contribution to engine emissions and performance. Final report, 20:6142 (R;US)

Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses
Geochemical investigations related to the Yucca Mountain environment and potential nuclear waste repository, 20:5189 (R;US)

SRI International, Menlo Park, CA (United States)
Advanced separation technology for flue gas cleanup. Quarterly technical report No. 9, April 1994–June 1994, 20:4943 (R;US)
Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring. Quarterly report, January 1, 1994–March 31, 1994, 20:5409 (R;US)

Stadt Frankfurt am Main (Germany). Hochbauamt
Energy report 1991 of the city of Frankfurt am Main, 20:5979 (I;DE;In German)

Stadt Hannover (Germany). Referatfuer Stadtentwicklung
An energy conservation plan for Hanover. Hanover energy concept. Pt. 4. 4.1: Fundamentals and energy conservation for private households. 4.2: Energy conservation in municipal and public-assistance buildings, 20:6095 (I;DE;In German)

Stanford Linear Accelerator Center, Menlo Park, CA (United States)
A fast tracking method using resonance basis Hamiltonians, 20:6383 (R;US)
A ppM-focused klystron at X-band with a travelling-wave output structure, 20:6417 (R;US)
A study of K_s Λ and $\bar{\Lambda}$ production in hadronic Z^0 decays, 20:6748 (R;US)
Accelerator modeling system for the future, 20:6379 (R;US)
Crossing symmetry is incompatible with general relativity, 20:6661 (R;US)
Current experiments in elementary particle physics. Revision, 20:6665 (R;US)
Geometry of multihadron production, 20:6749 (R;US)
Higher order mode damping for a detuned structure, 20:6413 (R;US)
Manifold damping of the NLC detuned accelerating structure, 20:6415 (R;US)
Operation and performance of a longitudinal feedback system using digital signal processing, 20:6416 (R;US)
Performance of the SLD Central Drift Chamber, 20:6414 (R;US)
Spin structure of the nucleon and polarization, 20:6758 (R;US)
Status of the PEP-II asymmetric B-Factory, 20:6430 (R;US)
Studies of strong electroweak symmetry breaking at future e^+e^- linear colliders, 20:6708 (R;US)
The impact of QCD and light-cone quantum mechanics on nuclear physics, 20:6771 (R;US)

Stanford Univ., CA (United States). High Temperature Gasdynamics Lab.
Mechanisms of pyrite oxidation to non-slagging species. Quarterly report, September 1–September 30, 1994, 20:4988 (R;US)

State Univ. of New York, Binghamton, NY (United States). Dept. of Chemistry
Photochemical coal dissolution. Quarterly technical progress report, April 1, 1994–June 31, 1994, 20:4902 (R;US)

State Univ. of New York, Buffalo, NY (United States). Dept. of Chemistry
Group transfer and electron transfer reactions of organometallic complexes, 20:6281 (R;US)

State Univ. of New York, Old Westbury, NY (United States)
Atmospheric peroxides. Technical progress report, 20:6529 (R;US)

State Univ. of New York, Stony Brook, NY (United States). Dept. of Earth and Space Sciences
Research in nuclear astrophysics: Stellar collapse and supernovae. Continuation progress report, December 1, 1994–November 30, 1995, 20:6651 (R;US)

Statens Forurensningstilsyn, Oslo (Norway)
Environmental effects of acute oil spills. Marine environment, 20:5023 (R;NO;In Norwegian)

Statens Planteavlsforsoeg, Lyngby (Denmark)
Ammonia volatilization from pig slurry and concentrated anaerobic fermented slurry. Measured by a new micrometeorological mass-balance technique, 20:5542 (R;DK;In Danish)

Statni Urad pro Jadernou Bezpecnost, Prague (Czech Republic)
Guidebook on training to establish and maintain the qualification and competence of nuclear power plant operations personnel, 20:6953 (I;CZ;In Czech)

Steag und VEW, Gemeinschaftskraftwerk Bergkamen A oHG (Germany)
STEAG und VEW, Gemeinschaftskraftwerk Bergkamen. Annual report 1993, 20:5669 (I;DE;In German)

Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)
Evaluation and comparison of different techniques for monitoring ammonia in flue gas, 20:6545 (R;SE;In Swedish)
Evaluation of SNCR-systems in steam- and hot water boilers in Sweden, 20:6544 (R;SE;In Swedish)

Stockholm Environment Inst., Tallin (Estonia)
Environmental impact assessment in Estonia, 20:6043 (R;SE;In , English)

Stoller (S.M.) Corp., Oak Ridge, TN (United States)
FY 1994 annual summary report of the surveillance and maintenance activities for the Oak Ridge National Laboratory Environmental Restoration Program, 20:5424 (R;US)

Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires
Detectors with gaseous micro strips (MSGC): realisation and tests, 20:6438 (R;FR;In French)

Stuttgart Univ. (Germany). Fakultaet 3 - Chemie
Electrical properties of pure and TiO_2-doped tetragonal ZrO_2, 20:6220 (I;DE;In German)

Stuttgart Univ. (Germany). Inst. fuer Kernenergetik und Energiesysteme
Coupling of aerosol behaviour and thermal-hydraulics. Reinforced concerted action on reactor safety source term project, 20:5887 (R;DE)

Swedish Environmental Research Inst., Goeteborg (Sweden)
Levels of SO_2, soot (black smoke), NO_2 and VOC in ambient air in Swedish urban areas, together with SO_2 and NO_2 at neighbouring rural sites, winter 1993-1994, 20:6537 (R;SE;In Swedish)

Swedish Environmental Research Inst., Stockholm (Sweden)
Integrated environmental monitoring at the municipal level - a conceptual outline, 20:5999 (R;SE;In Swedish)
Study of thermophilic anaerobic cleaning systems, 20:6581 (R;SE;In Swedish)

Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden)
A method for analysing the gas phase in polyurethane foam, 20:6256 (RA;SE)
A symmetrical sample arrangement for accurate creep measurements on rigid PUR foams at elevated temperatures, 20:6258 (RA;SE)
CFC-free polyurethane foam, 20:6133 (R;SE;In Swedish, English)
Electromagnetic noise in asynchronous generators, 20:5648 (R;SE;In Swedish)
Natural gas - Safety levels - Risk analysis, 20:5071 (R;SE;In Swedish)
The load bearing capacity of CFC-free pre insulated district heating pipes at service temperature. Test method for determination of the axial shear strength of heating mains, 20:6259 (RA;SE)

The load bearing capacity of CFC-free pre-insulated district heating pipes at service temperature. Creep due to radial compressive loading, 20:6260 (RA;SE)

Thermal conductivity and gas diffusion of rigid PUR foam. Part 1. Study of thermal conductivity and gas analysis for PUR insulation made with the blowing agents CFC 11, HCFC 141b and CO_2, 20:6255 (RA;SE)

Thermal conductivity of gaseous mixtures in foams. An evaluation of existing methods, 20:6257 (RA;SE)

Swedish National Testing and Research Inst., Boraas (Sweden)

Information security of remote-reading energy meters, 20:5969 (R;SE;In Swedish)

Swedish Transport and Communications Research Board, Stockholm (Sweden)

Alcohol and biogas - realistic fuels for cars, buses and trucks?, 20:6170 (R;SE)

Swedish Univ. of Agricultural Sciences, Umeaa (Sweden). Dept. of Animal Ecology

Radioactive cesium in boreal forest ecosystems, 20:6561 (R;SE;In Swedish)

Synfuels Engineering and Development, Inc., Arvada, CO (United States)

Combustion of municipal solid wastes with oil shale in a circulating fluidized bed. Quarterly report, quarter ending 31 December 1994, 20:5538 (R;US)

T

Technical Research Centre of Finland, Espoo (Finland)

Assessment of liquefaction and pyrolysis systems, 20:5537 (R;FI)

Computer-aided simulation of the heat treatment, 20:6215 (R;FI)

Greenhouse impacts of the use of peat and wood for energy, 20:4956 (R;FI)

Radiation risk in Finland due to the nuclear power plant at Sosnovyj Bor, 20:5828 (R;FI;In Finnish)

Technology transfer between research laboratories and industry. Measurement and evaluation, 20:6021 (R;FI)

Traffic emissions in Russia and the Baltic States St. Petersburg, Leningrad Oblast, Republic of Karelia, Estonia, Latvia and Lithuania, 20:6110 (R;FI)

Technical Univ. of Denmark, Lyngby (Denmark). Inst. of Mathematical and Operations Research

Adaptive pitch control of wind turbine, 20:5644 (R;DK)

Modelling and control of a wind turbine, 20:5643 (R;DK)

On flow and supply temperature control in district heating systems, 20:6128 (R;DK)

Stochastic heat storage problem - solved by the progressive hedging algorithm, 20:5970 (R;DK)

Technische Hochschule Aachen (Germany)

Investigations into the recycling or the dumping of coal ash and flue gas purification residues, 20:4944 (R;DE;In German)

Technische Univ. Bergakademie Freiberg (Germany). Fachbereich Chemie

Comparison of geochemical computer programs and expansion of the thermodynamic data base for modelling high-saliniferous solutions. Phase 1. Final report, 20:5165 (R;DE;In German)

Technische Univ. Berlin (Germany). Fachbereich 12 - Verkehrswesen

Blade angle adjustment on wind turbines with individual flapping hinges. Final report, 20:5635 (R;DE;In German)

Technische Univ. Braunschweig (Germany). Fakultaet fuer Maschinenbau und Elektrotechnik

A model of droplet evaporation in a supercritical pressure environment, 20:6336 (R;DE;In German)

Technische Univ. Braunschweig (Germany). Inst. fuer Oberflaechentechnik und Plasmatechnische Werkstoffentwicklung

High temperature low cycle fatigue in flue gas atmosphere, 20:6180 (R;DE)

Technische Univ. Braunschweig (Germany). Inst. fuer Technische Chemie

Catalytic regeneration of diesel soot filters. Final report, 20:6148 (R;DE;In German)

Technische Univ. Clausthal, Clausthal-Zellerfeld (Germany). Mathematisch-Naturwissenschaftliche Fakultaet

Heterocompounds in mineral oils of different classification, 20:5026 (I;DE;In German)

Technische Univ. Muenchen (Germany). Lehrstuhl fuer Botanik

Influence of air pollutants and other factors of stress on phytohormone concentrations in trees. Final report. Pt. 2, 20:6627 (I;DE;In German)

Technische Univ. Muenchen, Freising (Germany). Fakultaet fuer Landwirtschaft und Gartenbau

Formation and behaviour of halogenated dibenzodioxins and dibenzofurans in thermal processes, 20:6301 (I;DE;In German)

Technische Werke der Stadt Stuttgart Antigua and Barbuda (TWS) (Germany). Hauptabteilung Rohrnetze fuer Gas, Wasser, Fernwaerme

New piping techniques through insulated, compensating ductile cast iron socket pipes and efficient laying of supply pipes. Part-project: New techniques for service pipe insertion, 20:6309 (R;DE;In German)

New piping techniques through insulated, compensating ductile cast iron socket pipes and efficient laying of supply pipes. Final report, 20:6310 (R;DE;In German)

Technischer Ueberwachungs-Verein Hannover e.V. (Germany)

Highly volatile chlorinated hydrocarbons in Lower Saxony. Pt. 1. Production and application. Short version, 20:6532 (I;DE;In German)

TECOGEN, Inc., Waltham, MA (United States)

Commercial and industrial boiler modification program for improved efficiencies. Technical progress report No. 1, April 1994–June 1994, 20:6354 (R;US)

Tellus Inst., Inc., Boston, MA (United States)

Energy implications of integrated solid waste management systems. Final report, 20:6122 (R;US)

Tennessee Technological Univ., Cookeville, TN (United States). Dept. of Physics

Research in nuclear physics: Progress report, June 1, 1993–July 31, 1994, 20:6761 (R;US)

Tennessee Univ., Knoxville, TN (United States)

Meeting report: Sixth International Symposium on Resonance Ionization Spectroscopy and its Applications, 20:6467 (R;US)

Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy

The effect of magnetic field on the edge plasmons of two-dimensional electron gas systems, 20:6857 (R;US)

Tennessee Univ., Tullahoma, TN (United States). Space Inst.

Technical progress report for the magnetohydrodynamics coal-fired flow facility, July 1, 1994–September 30, 1994, 20:6073 (R;US)

Tennessee Valley Authority, Chattanooga, TN (United States)

Aerial inventory of land uses and nonpoint pollution sources in the Lick Creek Watershed of the Nolichuky River Basin, 20:6580 (R;US)

Convective circulation during differential heating and cooling in the Minky Creek embayment of Guntersville Reservoir, data summary for 1991, 20:5550 (R;US)

General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition, 20:6570 (R;US)

Tennessee Valley Authority, Chattanooga, TN (United States). Div. of Water Resources

Chickamauga reservoir embayment study - 1990, 20:5551 (R;US)

Tennessee Valley Authority, Knoxville, TN (United States)

Flue gas desulfurization gypsum and fly ash, 20:4955 (R;US)

Tennessee Valley Authority Eagle Bend 161-kV delivery point environmental assessment, 20:5966 (R;US)

Tennessee Valley Authority, Muscle Shoals, AL (United States)

Environmental site assessment, 20:6943 (R;US)

Tennessee Valley Authority, Muscle Shoals, AL (United States). Aquatic Biology Dept.

Aquatic Plant Management Program current status and seasonal workplan, 20:5549 (R;US)

Texas A and M Univ., College Station, TX (United States)

Photon detector for MEGA. Final report, July 16, 1992–May 31, 1993, 20:6728 (R;US)

Texas Univ., Austin, TX (United States)
The railplug: Development of a new ignitor for internal combustion engines. Final report, 20:6140 (R;US)
Transport suppression by diamagnetic phase shift as a possible mechanism to the L to H transition, 20:6867 (R;US)

Texas Univ., Austin, TX (United States). Fusion Research Center
Transport suppression by diamagnetic phase shift as a possible mechanism to the L to H transition, 20:6867 (R;US)

Texas Univ., Austin, TX (United States). Inst. for Fusion Studies
Energetic particle drive for toroidicity-induced Alfven eigenmodes and kinetic toroidicity-induced Alfven eigenmodes in a low-shear Tokamak. Revised, 20:6868 (R;US)
Envelope evolution of a laser pulse in an active medium, 20:6368 (R;US)

Thermochem, Inc., Columbia, MD (United States)
Pulsed atmospheric fluidized bed combustion. Technical progress report, July 1994–September 1994, 20:4979 (R;US)

Thermodyne Evaporators, Portland, ME (United States)
Super heated vapor drying process, 20:6111 (R;US)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
Double-strangeness five-body system, 20:6742 (R;JP)
Evidence of central repulsion potential from pionic decay of s-shell Λ-hypernuclei, 20:6781 (R;JP)
Exotic states of hadronic atoms, 20:6743 (R;JP)
Global aspects of the WZNW reduction to Toda theories, 20:6674 (R;JP)
Hadron-nucleon scattering lengths in QCD sum rules, 20:6744 (R;JP)
Non-critical string field theory with non-orientable string interactions, 20:6670 (R;JP)

300 Area treated effluent disposal facility sampling schedule, 20:5373 (R;US)
305 Building Cold Test Facility Management Plan, 20:5751 (R;US)
45-Day deliverable for Tank 241-BX-105 Auger samples, risers 2 and 6, 20:5290 (R;US)
45-Day safety screening for Tank 241-B-102 auger samples, riser 1, 20:5291 (R;US)
Acceptance of feed streams for treatment at the LERF/ETF complex, 20:5236 (R;US)
Acceptance test procedure for tank bottom thermocouples on Tank 241-SY-101. Revision 2, 20:5282 (R;US)
Acceptance/operational test procedure 103-SY tank camera purge control system, 20:5302 (R;US)
Acceptance/operational test procedure 241-AN-107 Video Camera System, 20:5304 (R;US)
Activity Management System user reference manual. Revision 1, 20:7080 (R;US)
Analysis of BY-106 pump pit cover plate, 20:5287 (R;US)
Analysis report for 241-BY-104 Auger samples, 20:5317 (R;US)
Application of DOE prescribed guides to the evaluation of Hanford's Mixed Low Level Solid Waste Treatment Options, 20:5262 (R;US)
Application of infrared imaging in ferrocyanide tanks, 20:5332 (R;US)
Architecture synthesis basis for the Hanford Cleanup system: First issue, 20:5437 (R;US)
As-built design criteria: B-234 cathodic protection, C.P. wire to pipe connections, 20:5213 (R;US)
Assessment report for Hanford analytical services quality assurance plan, 20:6277 (R;US)
B Plant Complex generator dangerous waste storage areas inspection plan: Revision 1, 20:5308 (R;US)
B Plant complex hazardous, mixed and low level waste certification plan, 20:5238 (R;US)
B Plant complex treatment, storage, and disposal units inspection plan, 20:5301 (R;US)
Bases for PUREX deactivation safety equipment list, 20:5440 (R;US)
Boundry description for removal of water cooled chillers, 20:5279 (R;US)
Calculating cost-training billback at WHC, 20:5987 (R;US)
Characterization of hazardous constituents in HLW supernate and implications for solid LLW generation, 20:5350 (R;US)
Cold test data for equipment acceptance into 105-KE Basin, 20:5247 (R;US)
Compliance matrix for the mixed waste disposal facilities, Trenches 31 & 34, burial ground 218-W-5, 20:5312 (R;US)
Computer code input for thermal hydraulic analysis of Multi-Function Waste Tank Facility Title II design, 20:5269 (R;US)
Computer software design description for the Treated Effluent Disposal Facility (TEDF), Project L-045H, Operator Training Station (OTS), 20:5240 (R;US)
Conceptual design report, Hazardous Materials Management and Emergency Response (HAMMER) Training Center, 20:5447 (R;US)
Concrete samples for organic samples, data package and 222-S validation summary report. Addendum 1A, 20:6278 (R;US)
Configuration management program plan for Hanford site systems engineering, 20:5237 (R;US)
Consolidated fuel decay heat calculations, 20:5118 (R;US)
Control system design for robotic underground storage tank inspection systems, 20:5228 (R;US)
Criticality safety evaluation report for 300 Area N Reactor fuel fabrication and storage facility, 20:6323 (R;US)
CSER 79-028, Addendum 2: Security bar addition to pedestal storage racks in Room 3 in 2736-Z Building, 20:6324 (R;US)
Data management plan for the ultrasonic inspection of the double-shell tanks, 20:7081 (R;US)
Description of the grout system dynamic simulation, 20:5223 (R;US)
Design basis and requirements for 241-SY Modular Exhauster concrete pad and retaining wall, 20:5288 (R;US)
Design basis and requirements for 241-SY modular exhauster mechanical installation, 20:5289 (R;US)
Documentation for first annual testing and inspections of Benificial Uses Shipping System (BUSS) Cask, 20:6330 (R;US)
Documentation for fiscal year 1995 annual BUSS cask SARP testing and inspections, 20:6331 (R;US)
Documentation for initial testing and inspections of Beneficial Uses Shipping System (BUSS) Cask, 20:6329 (R;US)
Dose rate analysis for Tank 101 AZ (Project W151), 20:5267 (R;US)
Double shell tanks emergency pumping plan, 20:5280 (R;US)
Effect of atmospheric humidity on CPAC optical moisture prediction models - interim report, 20:5296 (R;US)
Elevated drum testing Phase 1 test plan, 20:5459 (R;US)
Engineering evaluation of intrusion prevention strategies for single-shell tanks, 20:5295 (R;US)
Engineering study: 105KE to 105KW Basin fuel and sludge transfer. Final report, 20:5120 (R;US)
Engineering task plan for Tanks 241-AN-103, 104, 105 color video camera systems, 20:5298 (R;US)
Engineering work plan for container venting system drill press assembly troubleshooting. Revision 1, 20:6332 (R;US)
Engineering work plan for PFP criticality alarm panel first unit rebuild, 20:5441 (R;US)
Environmental releases for calendar year 1993, 20:5370 (R;US)
Factory Acceptance Test Procedure Westinghouse 100 ton Hydraulic Trailer, 20:5285 (R;US)
Fast flux test facility hazards assessment, 20:5874 (R;US)
Fast flux test facility, transition project plan, 20:5873 (R;US)

Feasibility/alternatives study for the planned replacement of Nuclear Material Safeguards System (NMSS), 20:5479 (R;US)
Fire alarm system improvement, 20:5439 (R;US)
First generation long-reach manipulator for retrieval of waste from Hanford single-shell tanks, 20:5225 (R;US)
Foam insulated transfer line test report, 20:5330 (R;US)
Functional design criteria for Project W-252, Phase II Liquid Effluent Treatment and Disposal: Revision 1, 20:5274 (R;US)
Functional design criteria radioactive liquid waste line replacement, Project W-087. Revision 3, 20:5260 (R;US)
Functions and requirements for Project W-236B, Initial Pretreatment Module: Revision 1, 20:5272 (R;US)
FY 95 engineering work plan for the design reconstitution implementation action plan, 20:5299 (R;US)
FY 95 engineering work plan to develop grading criteria for configuration management and design reconstitution, 20:5300 (R;US)
FY95 software project management plan: TMACS, CASS computer systems, 20:5314 (R;US)
Gas and liquid sampling for closed canisters in K-West basins - functional design criteria, 20:5245 (R;US)
Geophysical survey for proposed borehole 199-K-107A, 100-K Area, 20:5371 (R;US)
Grout Facilities standby plan, 20:5315 (R;US)
Hanford spent fuel inventory baseline, 20:5122 (R;US)
Hanford's Radioactive Mixed Waste Disposal Facility, 20:5227 (R;US)
Heat exchanger bypass test procedure, 20:5233 (R;US)
HIMACS file management software and strategies, 20:7079 (R;US)
Identification of single-shell tank in-tank hardware obstructions to retrieval at Hanford Site Tank Farms, 20:5224 (R;US)
Implementation plan for WRAP Module 1 operational readiness review, 20:5255 (R;US)
Instructions for borehole sampling, 20:6466 (R;US)
Integrated beta and gamma radiation dose calculations for the ferrocyanide waste tanks, 20:5320 (R;US)
Integrated test plan ResonantSonic drilling system technology demonstration-1995, at the Hanford Site: Revision 1, 20:5442 (R;US)
Interim dry cask storage of irradiated Fast Flux Test Facility fuel, 20:5116 (R;US)
Interim storage of sodium in ferritic steel tanks at ambient temperature, 20:5872 (R;US)
K Basins Field Verification Program, 20:5246 (R;US)
K-Basin isolation barrier seal, 20:5119 (R;US)
Laboratory procedures for waste form testing, 20:5443 (R;US)
Leachate storage transport tanker loadout piping, 20:5253 (R;US)
Level maintenance for Tank 101-SY mitigation-by-mixing test. Revision 2, 20:5460 (R;US)
Light Duty Utility Arm System applications for tank waste remediation, 20:5229 (R;US)
Liquid Effluent Monitoring Information System (LEMIS) System Construction, 20:7082 (R;US)
Liquid effluent services and solid waste disposal interface control document, 20:5306 (R;US)
Load test of the 272W Building high bay roof deck and support structure, 20:6107 (R;US)
Load test of the 283W Clearwell Roof Deck and Support Structure, 20:6106 (R;US)
Location of equipment in the 105K East discharge chute for installation of isolation barriers (ref USQ 94-0041): Revision 1, 20:5127 (R;US)
Low level mixed waste thermal treatment technical basis report, 20:5273 (R;US)
Low-level waste certification plan, 20:5234 (R;US)
MAC, material accounting database user guide, 20:5480 (R;US)
MBA, mass balance area user guide, 20:5248 (R;US)
Measuring the strategic value of information technology investments, 20:7075 (R;US)
MIT upgrade acceptance test procedure, 20:5283 (R;US)
Mixer pump long term operations plan for Tank 241-SY-101 mitigation, 20:5307 (R;US)
Multi-Function Waste Tank Facility thermal hydraulic analysis for Title II design, 20:5268 (R;US)
New supply for canyon fire foam system, 20:5875 (R;US)
NFR TRIGA package design review report, 20:6325 (R;US)
Non-destructive examination of grouted waste, 20:5322 (R;US)
Operability test procedure for 211BA flow proportional sampler, 20:5303 (R;US)
Operability test report for 211BA flow proportional sampler, 20:5305 (R;US)
Operational test report for LERF Basin 242AL-44 integrity test, 20:5265 (R;US)
Operational test report for WESF diesel generator diesel tank installation, 20:5024 (R;US)
Overheads, Safety Analysis and Engineering FY 1995 Site Support Program Plan WBS 6.3.5, 20:5464 (R;US)
Permitting plan for Project W-340, Tank 241-C-106 manipulator retrieval arm, 20:5275 (R;US)
PFP MICON maintenance manual, 20:5231 (R;US)
PFP up-right lift UL-20/26 manlifts, 20:5107 (R;US)
Plutonium Finishing Plant Transition Project mission analysis report, 20:5106 (R;US)
Preliminary flowsheet for plasma arc calcination of selected Hanford tank waste, 20:5318 (R;US)
Preliminary safety equipment list for Tank 241-C-106 Manipulator Retrieval System, Project W-340, 20:5451 (R;US)
Preliminary safety evaluation for 241-C-106 waste retrieval, project W-320, 20:5309 (R;US)
Project Management Plan 105-KE Basin sludge retrieval and packaging, 20:5121 (R;US)
Project plan, Hazardous Materials Management and Emergency Response Training Center: Project 95L-EWT-100, 20:5448 (R;US)
Project specific quality assurance plan, W-151, Tank 241-AZ-101 waste retrieval system. Revision 2, 20:5266 (R;US)
Project T100 – Hazardous Materials Management and Emergency Response Training Center (HAMMER), 20:5449 (R;US)
Project W-049H collection system Acceptance Test Procedure, 20:5257 (R;US)
Project W-049H instrument and control Acceptance Test Procedure, 20:5258 (R;US)
Quarterly report on the Ferrocyanide Safety Program for the period ending September 30, 1994, 20:5436 (R;US)
Radioisotope thermoelectric generator transportation system subsystem 143 software development plan, 20:6146 (R;US)
Radionuclide logging of Tank 216-T-106, borehole 299-W10-196, 20:5372 (R;US)
Readiness assessment plan for the Radioactive Mixed Waste Land Disposal Facility (Trench 31), 20:5252 (R;US)
Readiness plan, Hanford 300 Area Treated Effluent Disposal Facility: Revision 1, 20:5244 (R;US)
Recommendation for sanitary waste water system replacement, 222-S, 20:5276 (R;US)
Recommendations for erosion-corrosion allowance for Multi-Function Waste Tank Facility tanks, 20:5226 (R;US)
Review of consequences of uranium hydride formation in N-Reactor fuel elements stored in the K-Basins, 20:5446 (R;US)
RFAR installation for Buildings 703, 712, 747, 748 and 1163, 20:5444 (R;US)
RGA-5 process gas analyzer test report, 20:5331 (R;US)
Rotary mode core sampling service trailer Acceptance Test Plan, 20:5284 (R;US)
Safety equipment list for 241-C-106 waste retrieval, Project W-320: Revision 1, 20:5458 (R;US)
Search Hanford accessible reports electronically system design description. Revision 1, 20:7076 (R;US)
Search Hanford accessible reports electronically system requirements specification, 20:7077 (R;US)
Search Hanford Accessible Reports Electronically system test plan and documentation: Revision 1, 20:7078 (R;US)

Investigations into coal coprocessing and coal liquefaction, 20:4890 (R;US)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.

Subject Index

This index is arranged by subject descriptors selected from those assigned to each citation in this publication. Subject descriptors are selected from a controlled thesaurus of terms, ETDE/PUB–2(Rev.1), *International Energy: Subject Thesaurus.* In order to enhance indexing, subject descriptor entries generally consist of a pair of descriptors: a main term and a qualifier term. Each entry includes the full title (which may be followed by supplementary descriptive information in parentheses) and the citation number. Additional information given in parentheses indicates the document type (an abbreviation such as B for book), the country of publication (such as DE for Federal Republic of Germany), and the language if non-English.

See references guide users from synonymous terms to the descriptors selected for the concept. *See also* references indicate subject concepts that are more specific than a particular descriptor. To gain complete subject coverage, all such terms should be reviewed.

Fluidization studies using Phillips Z-SORB sorbent, 20:4936 (RA;US)
Fluidized-bed sorbents, 20:4935 (RA;US)
Hot gas cleaning, 20:4907 (R;DK;In Danish, English)
Interactions between creep and corrosion in alloy 800, 20:6206 (RA;US)
Stabilization of spent calcium-based sorbent, 20:4938 (RA;US)
Testing of full size fiber reinforced hot-gas filters fabricated by chemical vapor deposition, 20:5676 (RA;US)
Thermal/chemical degradation of inorganic membrane materials, 20:4940 (RA;US)

COAL GASIFICATION
CAVSIM. Underground Coal Gasification Program, 20:4903 (CM;US)
Development of an advanced, continuous mild gasification process for the production of co-products. Quarterly report, July 1994–September 1994, 20:4891 (R;US)
Development of hollow fiber catalytic membrane reactors for high temperature gas cleanup. Final report, September 1989–March 1994, 20:4892 (R;US)
Fiscal 1993 coal production/utilization technology promotion subsidy. Next generation coal utilization technology (survey of the trend of technology development and evaluation study by researchers in Japan), 20:4906 (R;JP;In Japanese)
Scaleup of IGT MILDGAS Process to a process development unit, 20:4889 (R;US)
Studies of in-situ calcium based sorbents in advanced pressurized coal conversion systems. Final report, June 1991–October 1994, 20:4893 (R;US)

COAL GASIFICATION PLANTS
A novel, integrated treatment system for coal waste waters. Quarterly report, June 2, 1994–September 1, 1994, 20:4942 (R;US)
Scaleup of IGT MILDGAS Process to a process development unit, 20:4889 (R;US)

COAL INDUSTRY
Saarbergwerke AG. Annual report 1992, 20:5986 (I;DE;In German)
Saarbergwerke AG. Business report 1993, 20:4994 (I;DE;In German)
U.S. energy industry financial developments, 1994 third quarter, 20:5985 (R;US)

COAL LIQUEFACTION
Advanced direct coal liquefaction concepts - appendix, 20:4899 (R;US)
Investigations into coal coprocessing and coal liquefaction, 20:4890 (R;US)

COAL LIQUEFACTION PLANTS
A novel, integrated treatment system for coal waste waters. Quarterly report, June 2, 1994–September 1, 1994, 20:4942 (R;US)
Advanced direct coal liquefaction concepts - appendix, 20:4899 (R;US)

COAL LIQUIDS
Ceramic catalyst materials, 20:4908 (RA;US)
Development of an advanced, continuous mild gasification process for the production of co-products, 20:4895 (RA;US)
Final report for "Production of mild gasification co-products" project, 20:4894 (R;US)
Fundamental studies of catalytic processing of synthetic liquids. Final report, 20:4897 (R;US)
Thermodynamic and rheological properties of solid-liquid systems in coal processing, 20:4911 (R;US)
Value-added co-products from K-M/IGT Facility, 20:4896 (RA;US)

COAL MINES
Evaluation and optimization of vertical gob gas ventilation wells, 20:4957 (RA;US)

COAL MINING
Commercialization of previously wasted coal mine gob gas and coalbed methane, 20:4933 (RA;US)

COAL PREPARATION
COALEVAL. Mine-to-market Analysis Low Ash Coal, 20:7048 (CM;US)
Next generation coal utilization research and development. Advanced coal cleaning technology, 20:4905 (R;JP;In Japanese)

COAL PREPARATION PLANTS
Bench scale testing of micronized magnetite beneficiation, 20:4874 (RA;US)
Development of the tribo-electrostatic fine coal separator, 20:4883 (RA;US)
Durability of various raw and dried low-rank coals, 20:4880 (RA;US)
Electrostatic beneficiation of coal, 20:4881 (RA;US)
Engineering development of advanced physical fine coal cleaning for premium fuel applications, 20:4875 (RA;US)
Engineering development of advanced physical fine coal cleaning technologies - froth flotation, 20:4878 (RA;US)
Evaluation, engineering and development of advanced cyclone processes, 20:4877 (RA;US)
New flotation schemes for enhanced pyrite rejection, 20:4879 (RA;US)
Non-intrusive measurement of particle charge: Electrostatic dry coal cleaning, 20:4882 (RA;US)
Recovery and utilization of fine clean coal in a thermal dryer system, 20:4871 (RA;US)
Update of the LICADO coal cleaning process, 20:4876 (RA;US)

COAL SEAMS
A novel geotechnical/geostatistical approach for exploration and production of natural gas from multiple geologic strata. Technical progress report, July–September 1994, 20:5030 (R;US)
Multistrata exploration and production study, 20:5043 (R;US)

COAL-DERIVED GASES

COMBINED SOXNOX PROCESSES
See also NOXSO PROCESS
Pilot-scale testing of a new sorbent for combined SO_2/NO_x removal. Final report, 20:5693 (R;US)

COMBINED STEAM-POWER GENERATION
See COGENERATION

COMBINED-CYCLE POWER PLANTS
Advanced coal-fueled gas turbine systems, 20:5660 (R;US)
Advanced staged combustion system for power generation, 20:5650 (R;US)
Coal-fired high performance power generating system. Quarterly progress report, January 1, 1994–March 31, 1994, 20:5666 (R;US)
Coal-fired performance power generating system, 20:5651 (RA;US)
Combined-cycle power tower, 20:5568 (R;US)
Development of a high-performance coal-fired power generating system with a pyrolysis gas and char-fired high-temperature furnace, 20:5653 (RA;US)
Fabrication of fiber-reinforced composites by chemical vapor infiltration, 20:5671 (RA;US)
Integration of an advanced technology gas turbine in an air blown gasifier, 20:5661 (R;US)
Research and development promotion survey. Survey of the trend of clean coal technology in the U.S., 20:4904 (R;JP;In Japanese)

Testing of full size fiber reinforced hot-gas filters fabricated by chemical vapor deposition, 20:5676 (RA;US)
Trace element emissions, 20:5682 (RA;US)
Trace species emissions for IGFC, 20:5684 (RA;US)

COMBUSTION
See also FLUIDIZED-BED COMBUSTION
SPONTANEOUS COMBUSTION
Mathematical modeling and numerical simulation of chemical kinetics in turbulent combustion, 20:6303 (R;NO)
Nonequilibrium multiphase mixture modeling of energetic material response, 20:6304 (R;US)

COMBUSTION CONTROL
SnO_2 sensors for measurement of combustion in industrial facilities and processes, 20:4991 (I;DK;In Danish)

COMBUSTION PRODUCTS
See also ASHES
Coal-fired high performance power generating system. Quarterly progress report, January 1, 1994–March 31, 1994, 20:5666 (R;US)
Recent progress in the use of synchrotron radiation for the analysis of coal combustion products, 20:5657 (RA;US)

COMBUSTORS
See also CATALYTIC COMBUSTORS
CYCLONE COMBUSTORS
FLUIDIZED-BED COMBUSTORS
Commercial and industrial boiler modification program for improved efficiencies. Technical progress report No. 1, April 1994–June 1994, 20:6354 (R;US)
Development & testing of industrial scale, coal fired combustion system, Phase 3. Tenth quarterly technical progress report, April 1, 1994–June 30, 1994, 20:5667 (R;US)
Development and testing of a high efficiency advanced coal combustor: Industrial boiler retrofit, 20:4969 (RA;US)
Development of a rotary combustor for refiring pulverized coal boilers, 20:5680 (RA;US)
Investigation of properties and performance of ceramic composite components, 20:5673 (RA;US)
Status report on the development of a low NO_x combustor, 20:4978 (RA;US)

COMMERCIAL BUILDINGS
EIA new releases, 20:6066 (R;US)

COMMERCIAL SECTOR
1993 State-by-state assessment of low-level radioactive wastes received at commercial disposal sites, 20:5152 (R;US)
Summary of California DSM impact evaluation studies, 20:6135 (R;US)

COMMERCIALIZATION
Environmental assessment for commercialization of the Mound Plant, 20:5991 (R;US)

UNDERGROUND EXPLOSIONS

FLOTATION
Micro-agglomerate flotation for deep cleaning of coal. Quarterly progress report, July 1–September 30, 1994, 20:4887 (R;US)

FLOW (FLUID)
See FLUID FLOW

FLOWMETERS
Surge suppressors for the PRTR process tube flow meters, 20:5817 (R;US)

FLUE GAS
Air Pollution Monitoring
Tunable diode lasers as continuous emission monitors for thermal waste treatment processes, 20:6543 (R;US)

Cleaning
Pilot-scale tests for EB flue gas treatment process in Japan, 20:5497 (IA;PL)

Deashing
Bench-scale and pilot-plant evaluation of additives for improved particle collection in electrostatic precipitators, 20:4919 (RA;US)
Catalytic fabric filtration for simultaneous NO_x and particulate control, 20:4921 (RA;US)
Ceramic filter for fine particulate control, 20:4928 (RA;US)
Fundamental mechanisms in flue gas conditioning, 20:4918 (RA;US)
Non-toxic additives for improved fabric filter performance, 20:4920 (RA;US)

Decarbonization
An overview of CO_2 recovery technologies, 20:4946 (RA;US)
Potential for terrestrial disposal of carbon dioxide in the U.S., 20:4945 (RA;US)
Systems and economic analysis of microalgae ponds for conversion of CO_2 to biomass, 20:4948 (RA;US)
The Carnol process for methanol production and utilization with reduced CO_2 emissions, 20:4947 (RA;US)

Denitrification
Catalytic fabric filtration for simultaneous NO_x and particulate control, 20:4921 (RA;US)
Development of a metal chelate additive for use in wet limestone systems to remove simultaneous SO_2 and NO_x from flue gas, 20:4927 (RA;US)
Hollow fiber contactors for simultaneous SO_x/NO_x removal, 20:4922 (RA;US)
Plasma-assisted NH_3 injection for NO_x control, 20:5679 (RA;US)

Desulfurization
Bench-scale and pilot-plant evaluation of additives for improved particle collection in electrostatic precipitators, 20:4919 (RA;US)
Development of a metal chelate additive for use in wet limestone systems to remove simultaneous SO_2 and NO_x from flue gas, 20:4927 (RA;US)
Development of the integrated environmental control model: Update on project status, 20:4975 (RA;US)
Development status of advanced sorbent injection process for SO_2 control, 20:4924 (RA;US)
FGD waste disposal cost and sensitivity analysis, 20:4926 (RA;US)
Fundamental mechanisms in flue gas conditioning, 20:4918 (RA;US)
Hollow fiber contactors for simultaneous SO_x/NO_x removal, 20:4922 (RA;US)
Overview of recent research activities at EPRI's High Sulfur Test Center - April 1993 to March 1994, 20:4925 (RA;US)
Reduction of nitrogen oxides in the NOXSO Process, 20:4929 (RA;US)
Results of full-scale utility FGD SO_2 removal upgrade testing, 20:4923 (RA;US)

Detoxification
Evaluation and further development of various sampling and analytical methods for determining specific toxic emissions from coal-fired power plants, 20:5678 (RA;US)

Electron Beams
Electron beam coal combustion flue gas treatment developments in Poland, 20:5488 (IA;JP)
Introduction and historical review of electron beam processing for environmental pollution control, 20:5494 (IA;PL)

Filtration
Ceramic filter for fine particulate control, 20:4928 (RA;US)

Gas Chromatography
Measurements of nitrous oxide concentration, 20:5502 (IA;PL)

Monitoring
A study of toxic emissions from a coal-fired power plant demonstrating the ICCT CT-121 FGD project, 20:4949 (RA;US)
An innovative continuous emissions monitor for air toxic metals, 20:4996 (RA;US)
Assessment of mercury health risks to adults from coal combustion, 20:4997 (RA;US)
Comprehensive assessment of air toxics at Springerville Generating Station, 20:4951 (RA;US)
Evaluation of sorbents for enhanced mercury control, 20:4998 (RA;US)
Major findings and results from comprehensive assessment of emissions from two coal-fired power plants, 20:4950 (RA;US)
Measurement of mercury and other trace metals in combustion gases using active nitrogen energy transfer (ANET), 20:4999 (RA;US)

Radiolysis
Electron beam coal combustion flue gas treatment developments in Poland, 20:5488 (IA;JP)
IAEA final research co-ordination meeting on radiation processing of combustion flue gases. Poland, Zakopane, 24-28 May, 1993. Pts. 1-3, 20:5493 (I;PL)

Scrubbing
Advanced separation technology for flue gas cleanup. Quarterly technical report No. 9, April 1994–June 1994, 20:4943 (R;US)

Selective Catalytic Reduction
A study of toxic emissions from a coal-fired power plant utilizing the SNOX innovative clean coal technology demonstration. Volume 1, Sampling/results/special topics: Final report, 20:5690 (R;US)
A study of toxic emissions from a coal-fired power plant: Niles Station Boiler No. 2. Volume 2, Appendices: Final report, 20:5689 (R;US)

Air Heaters
Materials support for the development of High Temperature Advanced Furnaces (HITAF) - a comparison of selected mechanical properties for three SiC-based ceramics, 20:5652 (RA;US)

Air Pollution
A study of toxic emissions from a coal-fired power plant utilizing the SNOX innovative clean coal technology demonstration. Volume 1, Sampling/results/special topics: Final report, 20:5690 (R;US)
A study of toxic emissions from a coal-fired power plant: Niles Station Boiler No. 2. Volume 2, Appendices: Final report, 20:5689 (R;US)

Air Pollution Abatement
A study of toxic emissions from a coal-fired power plant utilizing the SNOX innovative clean coal technology demonstration. Volume 2, Appendices: Final report, 20:5691 (R;US)

Air Pollution Control
An assessment of mercury emissions and health risks from a coal-fired power plant, 20:4995 (R;US)
Coal reburning for cyclone boiler NO_x control demonstration. Quarterly report No. 14, July–September 1993, 20:4984 (R;US)

Boilers
Combustion improvements in stoker fired boilers, 20:4977 (RA;US)
Deposit growth and property development in coal-fired furnaces, 20:5658 (RA;US)
Development and testing of a high efficiency advanced coal combustor: Industrial boiler retrofit, 20:4969 (RA;US)
Development and testing of an industrial scale, coal fired slagging combustion system, 20:4968 (RA;US)
Development of a rotary combustor for refiring pulverized coal boilers, 20:5680 (RA;US)
Innovative Clean Coal Technology (ICCT): 500 MW demonstration of advanced wall-fired combustion techniques for the reduction of nitrogen oxide (NO_x) emissions from coal-fired boilers. Phase 3A, Low NO_x burner tests, 20:5688 (R;US)
Recent progress in the use of synchrotron radiation for the analysis of coal combustion products, 20:5657 (RA;US)
Status report on the development of a low NO_x combustor, 20:4978 (RA;US)

Carbon Dioxide
Generation planning and global environmental problems in the Asian and Pacific, 20:6036 (R;JP;In Japanese)

Combustors
Investigation of properties and performance of ceramic composite components, 20:5673 (RA;US)

Commercialization
Combustion 2000 low-emission boiler systems project - the ABB Team's Phase I activities, 20:5654 (RA;US)

Design
Combustion 2000 low-emission boiler systems project - the ABB Team's Phase I activities, 20:5654 (RA;US)
Engineering development of an advanced coal-fired low-emission boiler system, 20:5655 (RA;US)

Energy Efficiency
Generation planning and global environmental problems in the Asian and Pacific, 20:6036 (R;JP;In Japanese)

Federal Republic Of Germany
VEW-Harpen Kraftwerk Werne. Annual report 1993, 20:5668 (I;DE;In German)

Filters
Durability of ceramic filters, 20:4983 (RA;US)
Karhula hot gas cleanup test results, 20:4982 (RA;US)
Properties of ceramic candle filters, 20:5662 (RA;US)

Flue Gas
A study of toxic emissions from a coal-fired power plant utilizing the SNOX innovative clean coal technology demonstration. Volume 1, Sampling/results/special topics: Final report, 20:5690 (R;US)
A study of toxic emissions from a coal-fired power plant: Niles Station Boiler No. 2. Volume 2, Appendices: Final report, 20:5689 (R;US)

Fluidized Bed Boilers
HAP sampling at Tidd PFBC, 20:5683 (RA;US)
PFBC dust cake studies, 20:5664 (RA;US)
Results of patch tests, 20:5663 (RA;US)
The analysis and specification of large high-pressure, high-temperature valves for combustion turbine protection in second-generation PFB power plants: Topical report, 20:5659 (R;US)

Fluidized-Bed Combustors
Co-firing waste materials in an advanced pressurized fluidized-bed combustor, 20:5665 (RA;US)

Fuel Substitution
Compliance advisor: A software tool for fuel switching/blending to meet SO_2 regulations at coal-fired power plants, 20:4884 (RA;US)
Development of a phenomenological model for coal slurry atomization, 20:4915 (RA;US)
Viscoelastic behavior of beneficiated coal-water slurries and their atomization characteristics, 20:4914 (RA;US)

Granular Bed Filters
Pilot-scale testing of a new sorbent for combined SO_2/NO_x removal. Final report, 20:5693 (R;US)

Health Hazards
An assessment of mercury emissions and health risks from a coal-fired power plant, 20:4995 (R;US)

Heat Exchangers
Fabrication of fiber-reinforced composites by chemical vapor infiltration, 20:5671 (RA;US)
Investigation of properties and performance of ceramic composite components, 20:5673 (RA;US)
Recent progress in the use of synchrotron radiation for the analysis of coal combustion products, 20:5657 (RA;US)
Research on fundamental aspects of inorganic particle deposition in coal-fired equipment, 20:5656 (RA;US)
Transport properties of ceramic composites, 20:5672 (RA;US)

Hot Gas Cleanup
Tidd PFBC hot gas filter operating experience: July 1993 - April 1994, 20:4981 (RA;US)

Natural Gas
Generation planning and global environmental problems in the Asian and Pacific, 20:6036 (R;JP;In Japanese)

Operation
Kinetics and mechanisms of coal char combustion and carbon burnout, 20:4964 (RA;US)

Optimization
Coal-fired performance power generating system, 20:5651 (RA;US)

Performance
Coal-fired performance power generating system, 20:5651 (RA;US)
Development of a high-performance coal-fired power generating system with a pyrolysis gas and char-fired high-temperature furnace, 20:5653 (RA;US)
Engineering development of an advanced coal-fired low-emission boiler system, 20:5655 (RA;US)

Performance Testing
Development & testing of industrial scale, coal fired combustion system, Phase 3. Tenth quarterly technical progress report, April 1, 1994–June 30, 1994, 20:5667 (R;US)

Petroleum
Generation planning and global environmental problems in the Asian and Pacific, 20:6036 (R;JP;In Japanese)

Pollution Control Equipment
A study of toxic emissions from a coal-fired power plant demonstrating the ICCT CT-121 FGD project, 20:4949 (RA;US)
An innovative continuous emissions monitor for air toxic metals, 20:4996 (RA;US)
Assessment of mercury health risks to adults from coal combustion, 20:4997 (RA;US)
Ceramic filter for fine particulate control, 20:4928 (RA;US)
Comprehensive assessment of air toxics at Springerville Generating Station, 20:4951 (RA;US)
Comprehensive assessment of toxic emissions from coal-fired power plants, 20:5681 (RA;US)
Development of the integrated environmental control model: Update on project status, 20:4975 (RA;US)
Evaluation and further development of various sampling and analytical methods for determining specific toxic emissions from coal-fired power plants, 20:5678 (RA;US)
Evaluation of sorbents for enhanced mercury control, 20:4998 (RA;US)
FGD waste disposal cost and sensitivity analysis, 20:4926 (RA;US)
Hazardous air pollutant sampling for advanced power systems, 20:5685 (RA;US)

Instrumentation for trace emission measurements, 20:5686 (RA;US)
Major findings and results from comprehensive assessment of emissions from two coal-fired power plants, 20:4950 (RA;US)
Measurement of mercury and other trace metals in combustion gases using active nitrogen energy transfer (ANET), 20:4999 (RA;US)
Micronized coal firing applied to plants in the Czech Republic and Krakow, Poland, 20:4976 (RA;US)
Plasma-assisted NH_3 injection for NO_x control, 20:5679 (RA;US)
Reduction of nitrogen oxides in the NOXSO Process, 20:4929 (RA;US)

Radioactive Aerosols
Radiological hazard from coal-fired power plants in Poland, 20:6606 (R;PL;In Polish)

Steam Turbines
The analysis and specification of large high-pressure, high-temperature valves for combustion turbine protection in second-generation PFB power plants: Topical report, 20:5659 (R;US)

Waste Disposal
Market assessment and technical feasibility study of PFBC ash use, 20:5687 (RA;US)

Final technical report: DOE-High Energy Physics contract with the University of Hawaii, 20:6664 (R;US)
High Energy Accelerator and Colliding Beam User Group. Progress report, May 1, 1980–March 31, 1981, 20:6663 (R;US)
High Energy Physics Division semiannual report of research activities, January 1, 1994–June 30, 1994, 20:6710 (R;US)
High energy physics advisory panel's subpanel on vision for the future of high-energy physics, 20:6662 (R;US)
Proceedings of the conference on computing in high energy physics '94, 20:6410 (R;US)

HIGH ENERGY RADIOTHERAPY
See RADIOTHERAPY

HIGH EXPLOSIVES
See CHEMICAL EXPLOSIVES

HIGH FLUX NEUTRON SOURCE FACILITY
See NEUTRON SOURCE FACILITIES

HIGH-BETA PLASMA
q Profile evolution and enhanced core confinement of high β_p plasmas in DIII-D, 20:6869 (R;US)

HIGH-LEVEL RADIOACTIVE WASTES
Alpha Detection
45-Day deliverable for Tank 241-BX-105 Auger samples, risers 2 and 6, 20:5290 (R;US)

Chemical Analysis
Analysis report for 241-BY-104 Auger samples, 20:5317 (R;US)

Critical Mass
MBA, mass balance area user guide, 20:5248 (R;US)

Criticality
Nuclear criticality safety analysis summary report: The S-Area Defense Waste Processing Facility sludge-only operation, 20:6333 (R;US)

Encapsulation
MBA, mass balance area user guide, 20:5248 (R;US)

Monitoring
Quarterly report on the Ferrocyanide Safety Program for the period ending September 30, 1994, 20:5436 (R;US)

Quantitative Chemical Analysis
Characterization of hazardous constituents in HLW supernate and implications for solid LLW generation, 20:5350 (R;US)

Radiation Doses
Integrated beta and gamma radiation dose calculations for the ferrocyanide waste tanks, 20:5320 (R;US)

Radioactive Waste Management
Characterization of hazardous constituents in HLW supernate and implications for solid LLW generation, 20:5350 (R;US)
Design basis and requirements for 241-SY Modular Exhauster concrete pad and retaining wall, 20:5288 (R;US)
FY1993 annual report to Congress, 20:5161 (R;US)

Radioactive Waste Processing
Nuclear criticality safety analysis summary report: The S-Area Defense Waste Processing Facility sludge-only operation, 20:6333 (R;US)

Radioactive Waste Storage
Bulk and mechanical properties of the Paintbrush tuff recovered from borehole USW NRG-6: Data report, 20:5368 (R;US)
Depth geologic storage of high-level radioactive wastes, 20:5163 (R;ES;In Spanish)
Dose rate analysis for Tank 101 AZ (Project W151), 20:5267 (R;US)
Seismic design spectra 200 West and East Areas DOE Hanford Site, Washington, 20:5271 (R;US)
Tank 241-C-105 tank characterization plan, 20:5325 (R;US)
Tritium emissions from 200 East Area Double-Shell Tanks, 20:5374 (R;US)

Radiochemical Analysis
45-Day deliverable for Tank 241-BX-105 Auger samples, risers 2 and 6, 20:5290 (R;US)
Tank 241-AP-106 tank characterization plan, 20:5327 (R;US)

Remedial Action
Permitting plan for Project W-340, Tank 241-C-106 manipulator retrieval arm, 20:5275 (R;US)
Phase report 1C, TA-21 operable unit RCRA Facility Investigation, Outfalls Investigation, 20:5175 (R;US)

Safety
Safety and sensitivity analyses of a generic geologic disposal system for high-level radioactive waste, 20:5168 (R;JP)

Safety Analysis
Nuclear criticality safety analysis summary report: The S-Area Defense Waste Processing Facility sludge-only operation, 20:6333 (R;US)

Sampling
Analysis report for 241-BY-104 Auger samples, 20:5317 (R;US)
Tank 241-C-105 tank characterization plan, 20:5325 (R;US)

Separation Processes
Evaluation of concentrations of hazardous components to support removal of the Tank 48 thermowell, 20:5352 (R;US)
Functions and requirements for Project W-236B, Initial Pretreatment Module: Revision 1, 20:5272 (R;US)

Source Terms
Sludge source term (PUREX process radionuclide dose impact), 20:5465 (R;US)
Supernate source term analysis: Revision 1, 20:5466 (R;US)

Tanks
Acceptance test procedure for tank bottom thermocouples on Tank 241-SY-101. Revision 2, 20:5282 (R;US)
Dose rate analysis for Tank 101 AZ (Project W151), 20:5267 (R;US)

Thermal Gravimetric Analysis
45-Day deliverable for Tank 241-BX-105 Auger samples, risers 2 and 6, 20:5290 (R;US)

Underground Disposal
Hanford protoype surface barrier status report: FY 1994, 20:5204 (R;US)
Mechanical and bulk properties of intact rock collected in the laboratory in support of the Yucca Mountain Site Characterization Project, 20:5212 (R;US)
Mountain scale modeling of transient, coupled gas flow, heat transfer and carbon-14 migration, 20:5209 (R;US)
Phase report 1C, TA-21 operable unit RCRA Facility Investigation, Outfalls Investigation, 20:5175 (R;US)
Preliminary hydrogeologic assessment of boreholes UE-25c No. 1, UE-25c No. 2, and UE-25c No. 3, Yucca Mountain, Nye County, Nevada, 20:5220 (R;US)
Safety and sensitivity analyses of a generic geologic disposal system for high-level radioactive waste, 20:5168 (R;JP)
Stochastic modeling of the influence of environment on pitting corrosion damage of radioactive-waste containers, 20:5215 (R;US)

Underground Storage
Cesium uptake capacity of simulated ferrocyanide tank waste. Interim report FY 1994, Ferrocyanide Safety Project, 20:5197 (R;US)
Evaluation of sludge screening limit for Tank Farm Low Level Waste, 20:5351 (R;US)
High-level waste tank modifications, installation of mobilization equipment/check out, 20:5155 (R;US)
Specialized video systems for use in underground storage tanks, 20:5335 (R;US)

Vitrification
Integrated DWPF Melter System (IDMS) campaign report: Hanford Waste Vitrification Plan (HWVP) process demonstration, 20:5348 (R;US)
Vitrification of hazardous and radioactive wastes, 20:5344 (R;US)

HIGH-TC SUPERCONDUCTORS
Application of HTS technology to cardiac dysrhythmia detection, 20:6597 (R;US)
Design and production of efficient current leads for 1500-A, 50-Hz service in a 77-4 K temperature gradient, 20:5964 (R;US)
HTS current lead using a composite heat pipe, 20:6861 (R;US)
Ion-assisted laser deposition of intermediate layers for $YBa_2Cu_3O_{7-\delta}$ thin film growth on polycrystalline and amorphous substrates, 20:6231 (R;US)
Neutron scattering investigations into high-temperature superconductors, 20:6232 (R;CH;In German)
Phonon characteristics of high T_c superconductors from neutron Doppler broadening measurements, 20:6828 (R;US)
Radiation-acoustic study of a superconducting state in $YBa_2Cu_3O_7$, 20:6860 (IA;RU;In Russian)
Some aspects of critical currents in Ag sheathed $Bi_2Sr_2Ca_2Cu_3O_{10}$ composite tapes: A summary, 20:6217 (R;US)

HIGH-TEMPERATURE FUEL CELLS
Electrochemical studies of perovskite mixed conductors, 20:6227 (R;US)

HIGHLY ENRICHED URANIUM
Repository emplacement costs for Al-clad high enriched uranium spent fuel, 20:5339 (R;US)

HIGHWAYS
See ROADS

HISTAMINE
Optimization of the synthesis of a high specific activity ^{125}I-labelled hapten for radioimmunoassays, 20:6296 (R;ES;In Spanish)

HOFFMAN PROCESS
See COAL GASIFICATION

HOISTS
PFP up-right lift UL-20/26 manlifts, 20:5107 (R;US)
Structural integrity analysis of the 224U elevator mothballing, 20:5455 (R;US)

HOLLY EVENT
See NUCLEAR EXPLOSIONS

HOLZHEIMER PROCESS
See OIL SHALES

HONEY
Tritium concentrations in bees and honey at Los Alamos National Laboratory, 20:5362 (R;US)

HORIZONTAL AXIS TURBINES
Analysis operating and maintenance cost of Danish wind turbines in 1993, 20:5633 (R;DK;In Danish)
Data preparation requirements for modeling wind turbines with ADAMS®, 20:5647 (R;US)
Fatigue loads on a pitch regulated wind turbine operating in a coastal wind turbine array, 20:5649 (R;DK)
NREL airfoil families for HAWTs, 20:5646 (R;US)

HOT CELLS
Experimental investigations of sensor-based surface following performed by a mobile manipulator, 20:6123 (R;US)

HOT GAS CLEANUP
Development of hollow fiber catalytic membrane reactors for high temperature gas cleanup. Final report, September 1989–March 1994, 20:4892 (R;US)
Studies of in-situ calcium based sorbents in advanced pressurized coal conversion systems. Final report, June 1991–October 1994, 20:4893 (R;US)

HOT-DRY-ROCK SYSTEMS
Summary of recent flow testing of the Fenton Hill HDR reservoir, 20:5630 (R;US)

HOUSES
Extension of the actively solar heated single-family house at the Luebeck Polytechnic since 1982 for demonstration purposes by passive components and simultaneous increase of living comfort. Final report, 20:6098 (R;DE;In German)
Load management in one-family houses. Comparison between simulated and measured sequences, 20:6102 (R;SE;In Swedish)
The PV/Hydrogen system of the self-sufficient solar house, 20:5587 (RA;FI)

HTO

MAGNETOHYDRODYNAMIC CHANNELS
See MHD CHANNELS

MAGNETOHYDRODYNAMICS
A kinetic model for the global power transfer between particles and MHD waves, 20:6884 (RA;CH)

MAGNETOTELLURIC SURVEYS
Alignment
Application of 2 dimensional joint inversion of MT/ATM and Schlumberger data, 20:5621 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 1. Data acquisition system and data processing system, 20:5618 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

Data Acquisition
MT data processing using two sets of data acquired at the same site, 20:5617 (IA;JP;In Japanese)

Data Acquisition Systems
Magnetotelluric sounding at Bandai volcano. Part 1. Data acquisition system and data processing system, 20:5618 (IA;JP;In Japanese)

Data Analysis
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)
Application of 2 dimensional joint inversion of MT/ATM and Schlumberger data, 20:5621 (IA;JP;In Japanese)

Data Processing
Magnetotelluric sounding at Bandai volcano. Part 1. Data acquisition system and data processing system, 20:5618 (IA;JP;In Japanese)

Diagrams
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

Electric Conductivity
Fundamental study on two-dimensional inversion for MT interpretation, 20:5613 (IA;JP;In Japanese)

Energy Sources
CSMT and TDM survey in the Mori geothermal field, Hokkaido, North Japan, 20:5616 (IA;JP;In Japanese)

Evaluation
Application of magnetotellurics to petroleum exploration in Japan. Part 4. Evaluation of array measurement, 20:5005 (IA;JP;In Japanese)

Experimental Data
MT data processing using two sets of data acquired at the same site, 20:5617 (IA;JP;In Japanese)
Rapid relaxation inversion two-dimensional MT data. Part 3. Application to some field data, 20:5612 (IA;JP;In Japanese)

Extrapolation
Application of magnetotellurics to petroleum exploration in Japan. Part 4. Evaluation of array measurement, 20:5005 (IA;JP;In Japanese)

Frequency Dependence
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

Geodesics
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)
Application of magnetotellurics to petroleum exploration in Japan. Part 4. Evaluation of array measurement, 20:5005 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

Hz Range
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)

Interchangeability
CSMT and TDM survey in the Mori geothermal field, Hokkaido, North Japan, 20:5616 (IA;JP;In Japanese)

Matsukawa Geothermal Field
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)

Measuring Methods
Magnetotelluric sounding at Bandai volcano. Part 1. Data acquisition system and data processing system, 20:5618 (IA;JP;In Japanese)

Numerical Analysis
Rapid relaxation inversion two-dimensional MT data. Part 3. Application to some field data, 20:5612 (IA;JP;In Japanese)

Onuma Geothermal Field
Analysis of magnetotelluric data at Sengan-Sumikawa geothermal field, 20:5620 (IA;JP;In Japanese)

Site Characterization
MT data processing using two sets of data acquired at the same site, 20:5617 (IA;JP;In Japanese)

Spatial Distribution
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

Two-Dimensional Calculations
Fundamental study on two-dimensional inversion for MT interpretation, 20:5613 (IA;JP;In Japanese)

Wave Propagation
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

NUCLEAR DATA COLLECTIONS
Recent nuclear data activities in China related to CENDL-2, 20:6782 (RA;JP)

Reevaluation of FP nuclear data for JENDL-3.2, 20:6807 (RA;JP)
Request of nuclear data file for study of new application of transmutation, 20:5167 (RA;JP)
Study of nuclear data in Indonesia, 20:6805 (RA;JP)

NUCLEAR ENERGY
Environment of nuclear energy development and international cooperation of nuclear data activity, 20:6806 (RA;JP)
NEA activities in 1993. 22. Annual Report of the OECD Nuclear Energy Agency, 20:5750 (R;XN)

NUCLEAR EXPLOSION DETECTION
Proceedings of the Numerical Modeling for Underground Nuclear Test Monitoring Symposium, 20:6172 (R;US)
The Department of Energy's Comprehensive Test Bank Treaty Research and Development Program, 20:6524 (R;US)

NUCLEAR EXPLOSIONS
Containment
A comparison of the moisture gauge and the neutron log in air-filled holes at NTS, 20:6516 (RA;US)
A radio frequency interferometer (RIF) system, 20:6508 (RA;US)
A summary of LLNL containment: Diagnostics data, 1985-1993, 20:6512 (RA;US)
An electromagnetic hole separation survey tool, 20:6522 (RA;US)
An in-situ check of the epithermal neutron log calibration, 20:6518 (RA;US)
Calculations of NTS residual stress measurements and some implications for models and material properties, 20:6501 (RA;US)
Calculations of the FLAX events with comparisons to particle velocity data recorded at low stress, 20:6502 (RA;US)
Canonical wall loading functions for decoupled cavities and containment vessels, 20:6498 (RA;US)
Cavity gas pressure measurements on diamond fortune, 20:6492 (RA;US)
Close-in shock wave diagnostics on MIDDLE NOTE and MISSION CYBER, 20:6489 (RA;US)
Containing repeated low-yield nuclear explosions in steel-lined rock caverns, 20:6499 (RA;US)
Containment and safety data acquisition system for the LYNER complex, 20:6493 (RA;US)
Did the nuclear test moratorium of 1958 teach us anything?, 20:6479 (RA;US)
Distinct element modeling of late-time containment phenomena, 20:6500 (RA;US)
Do analytic models of near source pipe flow compare to measurement?, 20:6487 (RA;US)
Dynamic response of PCGC-1(O) grout, 20:6506 (RA;US)
Experimental determination of containment versus burial depth for explosions in sand, 20:6483 (RA;US)
Field permeability and strength tests of LANL grout and TPE plugs, 20:6511 (RA;US)
GALENA pressure history and a proposed sensor for mean residual stress, 20:6491 (RA;US)
Groundwater levels from well and test-hole data, Yucca Flat, Nevada Test Site, Nye County, Nevada, 1959-91, 20:6521 (RA;US)
In situ convergence measurements and initial analysis from mine-by experiments in U12P and U12N tunnels at the Nevada Test Site, Nye County, Nevada, 20:6514 (RA;US)
Initial cavity-growth/pipe-closure phenomena, 20:6486 (RA;US)
Low-yield event design and performance review, 20:6485 (RA;US)
Maximum likihood borehole corrections for dual-detector density logs, 20:6517 (RA;US)
More RAMS data for selected LANL events, 20:6513 (RA;US)
My thoughts about containment, 20:6481 (RA;US)
Polyurethane foam cable bundle block, 20:6510 (RA;US)
Properties of NTS tuff, 20:6505 (RA;US)
Recent observations of mechanical properties and microstructure of shock-conditioned tuff, 20:6504 (RA;US)
Residual stress implications due to variations of yield and depth-of-burial of two nearly simultaneous explosions, 20:6503 (RA;US)
Response of steel vessels and cavity liners to dynamic loading, 20:6497 (RA;US)
Review and analysis of stemming practices at LLNL with consideration of slumping phenomena, 20:6509 (RA;US)
Scaling of deeply buried explosions, 20:6484 (RA;US)
Site selection and containment evaluation for LLNL nuclear events, 20:6482 (RA;US)
Soil mounds at the Nevada Test Site: Natural or nuclear?, 20:6519 (RA;US)
Testbed design and analytic evaluation of a proposed very low yield DNA horizontal line-of-sight event, 20:6496 (RA;US)
The Containment Evaluation Panel: Background and foreground, 20:6480 (RA;US)
The second pipe flow in the line-of-sight pipe, 20:6488 (RA;US)
The size of underground cavities formed by nuclear devices: Implications of point-source solutions for geological materials, 20:6490 (RA;US)
Three-dimensional porous flow calculations of the LYNER concept, 20:6494 (RA;US)
Use of a simple constitutive model for volcanic rocks of the southwestern Nevada volcanic field for the determination of hugoniots in testing media of the Nevada Test Site, 20:6515 (RA;US)
Water-level map of eastern Pahute mesa and vicinity, Nevada Test Site, Nye County Nevada, 20:6520 (RA;US)
YOCOL measurement system for cavity collapse, 20:6507 (RA;US)

Detection
Containment related phenomenology from chemical kiloton, 20:6495 (RA;US)

Fallout
Development of the town data base: Estimates of exposure rates and times of fallout arrival near the Nevada Test Site, 20:6604 (R;US)

Nuclear Explosion Detection
A review of broadband regional discrimination studies of NTS explosions and western US earthquakes, 20:6173 (R;US)

Radiation Doses
Development of the town data base: Estimates of exposure rates and times of fallout arrival near the Nevada Test Site, 20:6604 (R;US)

Scaling
Scaling of deeply buried explosions, 20:6484 (RA;US)

Site Selection
Site selection and containment evaluation for LLNL nuclear events, 20:6482 (RA;US)

Tank characterization report for single-shell Tank 241-T-105, 20:5293 (R;US)
Waste tank vapor project: Vapor characterization of Tank 241-C-103: Data report for OVS samples collected from Sample Job 7b, Parts I and II, received 5/18/94 and 5/24/94, 20:5195 (R;US)

Chemical Properties
Tank 241-AW-101 tank characterization plan, 20:5323 (R;US)

Classification
Non-fuel assembly components: 10 CFR 61.55 classification for waste disposal, 20:5196 (R;US)

Combustion
An investigation of gas separation membranes for reduction of thermal treatment emissions, 20:5207 (R;US)

Compatibility
Tank 241-AP-106 tank characterization plan: Revision 1, 20:5328 (R;US)

Containment
In situ remediation: Developing containment technologies, 20:5431 (R;US)
Prototype Hanford Surface Barrier: Design basis document, 20:5132 (R;US)

Data Acquisition
Light Duty Utility Arm System applications for tank waste remediation, 20:5229 (R;US)

Decomposition
Organic Tanks Safety Program: Waste aging studies, 20:5198 (R;US)

Density
Acquisition and reduction of data obtained from Tank 101-SY in-situ ball rheometer, 20:5200 (R;US)

Evaluation
B Plant complex hazardous, mixed and low level waste certification plan, 20:5238 (R;US)

Grouting
Grout Facilities standby plan, 20:5315 (R;US)

Information Needs
Report on data requirements and hardware selection for in-situ ball viscometer, 20:5201 (R;US)

Information Systems
System requirements specification for waste information and control system, 20:5311 (R;US)

Infrared Thermography
Application of infrared imaging in ferrocyanide tanks, 20:5332 (R;US)

Land Transport
Foam insulated transfer line test report, 20:5330 (R;US)

Materials Handling
Double shell tanks emergency pumping plan, 20:5280 (R;US)

Mixing
Mixer pump long term operations plan for Tank 241-SY-101 mitigation, 20:5307 (R;US)

Moisture
Effect of atmospheric humidity on CPAC optical moisture prediction models - interim report, 20:5296 (R;US)

Monitoring
Control system design for robotic underground storage tank inspection systems, 20:5228 (R;US)

Philippine Nuclear Research Institute
Analytical methods of radwaste characterization, 20:5206 (R;PH)

Physical Properties
Tank characterization report for single-shell Tank 241-B-110, 20:5292 (R;US)

Radioactive Waste Processing
B Plant complex hazardous, mixed and low level waste certification plan, 20:5238 (R;US)
Method to synthesize dense crystallized sodalite pellet for immobilizing halide salt radioactive waste, 20:5193 (PA;US)

Radiolysis
Organic Tanks Safety Program: Waste aging studies, 20:5198 (R;US)

Rheology
Acquisition and reduction of data obtained from Tank 101-SY in-situ ball rheometer, 20:5200 (R;US)

Sampling
45-Day safety screening for Tank 241-B-102 auger samples, riser 1, 20:5291 (R;US)
Tank 241-BY-111 tank characterization plan, 20:5329 (R;US)

Temperature Measurement
An assessment of the potential for a steam bump in Hanford Waste Tank 241-C-106, 20:5294 (R;US)

Transmutation
Design and construction of a new DC proton injector, 20:5184 (R;US)

Transport
Engineering study: 105KE to 105KW Basin fuel and sludge transfer. Final report, 20:5120 (R;US)

Underground Storage
An assessment of the potential for a steam bump in Hanford Waste Tank 241-C-106, 20:5294 (R;US)
Control system design for robotic underground storage tank inspection systems, 20:5228 (R;US)
First generation long-reach manipulator for retrieval of waste from Hanford single-shell tanks, 20:5225 (R;US)
Light Duty Utility Arm System applications for tank waste remediation, 20:5229 (R;US)

Waste Transportation
Waste Management Facilities Cost Information for transportation of radioactive and hazardous materials. Revision 1, 20:5114 (R;US)

Rocky Flats Plant Site Environmental Report: 1993 Highlights, 20:5432 (R;US)
TWRS Systems Engineering Working Plan, 20:5461 (R;US)
UMTRA Project Office quality assurance program plan. Revision 6, 20:5137 (R;US)
Uranium Mill Tailings Remedial Action Project environmental protection implementation plan, 20:5387 (R;US)

Quality Assurance
Ensuring comparability of data generated by multiple analytical laboratories for environmental decision making at the Fernald Environmental Management Project, 20:5414 (R;US)

Recommendations
Phase report 1C, TA-21 operable unit RCRA Facility Investigation, Outfalls Investigation, 20:5175 (R;US)

Records Management
UMTRA Project Administrative Files Collection Records Management Program, 20:5142 (R;US)
UMTRA technical assistance contractor quality assurance program plan, 20:5136 (R;US)

Remote Viewing Equipment
Imaging through obscurations for sluicing operations in the waste storage tanks, 20:5428 (R;US)

Research Programs
Decontamination Systems Information and Research Program: Quarterly report, July–September 1994, 20:6548 (R;US)
Environmental Restoration Program waste minimization and pollution prevention self-assessment, 20:5412 (R;US)
FY 1994 annual summary report of the surveillance and maintenance activities for the Oak Ridge National Laboratory Environmental Restoration Program, 20:5424 (R;US)
In Situ Remediation Integrated Program. In situ physical/chemical treatment technologies for remediation of contaminated sites: Applicability, developing status, and research needs, 20:5993 (R;US)

Safety
Uranium Mill Tailings Remedial Action Project Safety Advancement Field Effort (SAFE) Program, 20:5386 (R;US)

Safety Standards
Identifying environmental safety and health requirements for the Fernald Environmental Restoration Management Corporation, 20:5413 (R;US)

Technology Assessment
Innovative technologies for in-situ remediation, 20:6571 (R;US)

REMOTE HANDLING EQUIPMENT
See also MANIPULATORS
Computer imaging of EBR-II handling equipment, 20:5732 (R;US)
First generation long-reach manipulator for retrieval of waste from Hanford single-shell tanks, 20:5225 (R;US)
Identification of single-shell tank in-tank hardware obstructions to retrieval at Hanford Site Tank Farms, 20:5224 (R;US)
Irradiation tests of critical components for remote handling in gamma radiation environment, 20:6903 (R;JP)

REMOTE SENSING
Remote sensor test range update, 20:6546 (R;US)

REMOTE VIEWING EQUIPMENT
Acceptance/operational test procedure 241-AN-107 Video Camera System, 20:5304 (R;US)
Engineering task plan for Tanks 241-AN-103, 104, 105 color video camera systems, 20:5298 (R;US)
Experimental investigations of sensor-based surface following performed by a mobile manipulator, 20:6123 (R;US)
Imaging through obscurations for sluicing operations in the waste storage tanks, 20:5428 (R;US)
Progress report on a fully automatic Gas Tungsten Arc Welding (GTAW) system development, 20:6184 (R;US)
The accident site portable integrated video system, 20:5433 (R;US)

RENEWABLE ENERGY SOURCES
See also BIOMASS
Prospects: 25 years GOPA 1990, 20:6065 (I;DE;In German)
Use of renewable energy sources in developing countries. The energy-economical situation in rural areas, 20:6068 (IA;DE;In German)

RESEARCH AND TEST REACTORS
See also RESEARCH REACTORS
TRIGA TYPE REACTORS
Final safeguards analysis, high temperature lattice test reactor. Revision 1, 20:5859 (R;US)
HEU-LEU conversion of non-power reactors licensed by the Nuclear Regulatory Commission, 20:5836 (RA;US)
Modeling and analysis of hydrogen detonation events in the Advanced Neutron Source reactor containment, 20:5880 (R;US)
The RERTR Program: A status report, 20:5829 (RA;US)

RESEARCH PROGRAMS
Design, construction and tests of an alternative power supply system for the utilisation of renewable resources. Final report, 20:5562 (R;DE)

Development promotion of innovative technology for the earth. Feasibility study of research exchange, 20:6018 (R;JP;In Japanese)
Project to promote development of global environmental industry technology. Project for international research exchange, 20:6002 (R;JP;In Japanese)
Research management at the interfaces, 20:6020 (R;US)
US Army Research Office research in progress, July 1, 1991–June 30, 1992, 20:6012 (R;US)

RESEARCH REACTORS
See also BER-2 REACTOR
DR-3 REACTOR
DEMOCRITUS REACTOR
FBRF REACTOR
FFTF REACTOR
GTRR REACTOR
IAN-R1 REACTOR
JMTR REACTOR
JRR-2 REACTOR
JRR-3 REACTOR
JRR-4 REACTOR
KUR REACTOR
NRU REACTOR
OSIRIS REACTOR
PRTR REACTOR
R2-0 REACTOR
UVAR REACTOR
Early detection of coolant boiling in research reactors with MTR-type fuel, 20:5877 (RA;US)
Life-cycle cost analysis for Foreign Research Reactor, Spent Nuclear Fuel disposal, 20:5340 (R;US)
Technology risk assessment of foreign research reactor spent nuclear fuel dry storage, 20:5129 (R;US)

RESERVOIR ROCK
Dynamic reservoir imaging by electrical method in steam stimulation process. Results observed in the field, 20:5082 (IA;JP;In Japanese)
LBL/industry Heterogeneous Reservoir Performance Definition Project, 20:5035 (RA;US)
Reservoir thermal structure in Niigata oilfield, 20:5004 (IA;JP;In Japanese)

RESERVOIRS (WATER)
See WATER RESERVOIRS

RESIDENCES
See HOUSES

RESIDENTIAL BUILDINGS
See also APARTMENT BUILDINGS
HOUSES
Additional investment costs of low-energy house building. Actual costs of state-sponsored residential buildings in Hesse and Schleswig Holstein, 20:6096 (I;DE;In German)
Cost-effective energy efficiency in the Czech Republic, 20:6136 (R;US)
Energy-saving construction and healthy living. A planning aid for builder owners, architects and engineers, 20:6097 (I;DE;In German)
General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition, 20:6570 (R;US)
Krakow clean fossil fuels and energy efficiency project, 20:4966 (RA;US)
The Krakow Low Emissions Coal Briquette Project, 20:6091 (RA;US)
Utility investments in low-income-energy-efficiency programs, 20:6105 (R;US)

RESIDENTIAL SECTOR
Summary of California DSM impact evaluation studies, 20:6135 (R;US)

RESIDUES
See also ASHES
Baseline data compilation on radioactivity levels in drinking water, groundwater, waste water, sewage sludge, residues and wastes, accompanying the 1990 annual report on 'Environmental radioactivity and radiation burden', 20:6578 (I;DE;In German)
Laboratory procedures for waste form testing, 20:5443 (R;US)
Land application uses of dry FGD by-products. [Quarterly report, January 1, 1994–March 31, 1994], 20:4930 (R;US)

RESIDUES (RADIOACTIVE)
See RADIOACTIVE WASTES

RESINS
Solvent refining of fossil resin flotation concentrate from western coals, 20:4870 (RA;US)

RESISTAL
See COPPER BASE ALLOYS

RESISTIVITY SURVEYS
Quality control for resistivity inversions. Part 1. Proposal of TQARI, 20:6635 (IA;JP;In Japanese)
Sensitivity distribution for current focusing resistivity method, 20:5611 (IA;JP;In Japanese)
Study of effective electrode array of resistivity method, 20:5610 (IA;JP;In Japanese)

RESONANCE CAVITIES
See CAVITY RESONATORS

RESONANCE IONIZATION MASS SPECTROSCOPY
Meeting report: Sixth International Symposium on Resonance Ionization Spectroscopy and its Applications, 20:6467 (R;US)

RESONANCE STATES
See ENERGY LEVELS

RESOURCE DEVELOPMENT
Gulf of Mexico Sales 152 and 155: Central and Western Planning Areas. Final environmental impact statement, Volume 1: Sections I through IV.C, 20:6004 (R;US)
Gulf of Mexico Sales 152 and 155: Central and Western Planning Areas. Final environmental impact statement, Volume 2: Sections IV.D through IX, 20:6005 (R;US)

RESOURCE RECOVERY ACTS
Environmental implementation plan: Chapter 7, Groundwater protection, 20:5376 (R;US)
Methodology to remediate a mixed waste site, 20:5427 (R;US)

RESPIRABLE DUSTS
See DUSTS

RESPIRATORS
Effects of carbon blending and granule size layering on butane breakthrough curves, 20:6526 (R;US)

RESPIRATORY EQUIPMENT
See RESPIRATORS

RETORTS
Oil and gas yields from Devonian oil shale in the 50-lb/hr KENTORT II process demonstration unit: Initial results, 20:5085 (RA;US)

RETRIEVAL SYSTEMS
Development of a multi-functional scarifier dislodger with an integral pneumatic conveyance retrieval system for single-shell tank remediation. FY93 summary report, 20:5194 (R;US)
Preliminary safety equipment list for Tank 241-C-106 Manipulator Retrieval System, Project W-340, 20:5451 (R;US)
Safety equipment list for 241-C-106 waste retrieval, Project W-320: Revision 1, 20:5458 (R;US)

REVERSE-FIELD PINCH
Generation of fast electrons in reversed field pinches by the equilibrium grad |B| force, 20:6866 (R;US)

REZISTAL
See CHROMIUM ALLOYS
IRON BASE ALLOYS
NICKEL ALLOYS

RF SYSTEMS
Optical generation of radio-frequency power, 20:6321 (R;US)

RHENIUM COMPOUNDS
Carbons and hydrogen by persistent metal radicals. Final report, April 1, 1993–October 31, 1994, 20:6283 (R;US)

RHODOCOCCUS
Characterization of carbon-sulfur bond cleavage by axenic and mixed cultures of Rhodococcus rhodochrous IGTS8, 20:4888 (R;US)

RICHLAND FFTF REACTOR

SAFETY ANALYSIS
Strategy of severe accident physical modeling in view of recent requirements to safety analysis, 20:5895 (RA;US)
SAFETY STANDARDS
Search Hanford accessible reports electronically system requirements specification, 20:7077 (R;US)
SAFETY VALVES
See RELIEF VALVES
SALINE ZONE
See OIL SHALES
PICEANCE CREEK BASIN
SALMONELLA
Characterization of mutagenic activity in grain-based coffee-substitute blends and instant coffees, 20:6630 (R;US)
SALT CAVERNS
Triaxial creep measurements on rock salt from the Jennings dome, Louisiana, borehole LA-1, core #8, 20:5080 (R;US)
SALT DEPOSITS
Intermediate scale borehole (Room C): In situ data report (January 1989–June 1993), 20:5208 (R;US)
Radiation effects in rock salt. A status report, 20:5166 (R;DE)
Triaxial creep measurements on rock salt from the Jennings dome, Louisiana, borehole LA-1, core #8, 20:5080 (R;US)
SAMPLE PREPARATION
DOE methods for evaluating environmental and waste management samples, 20:6267 (R;US)
SAMPLERS
Operability test procedure for 211BA flow proportional sampler, 20:5303 (R;US)
Test procedure – Prototype core sampler, 20:5316 (R;US)
SAMPLING
SAMPSIZE/TIDSIZE. Computes Sample Sizes Based on the Hypergeometric Distribution, 20:7023 (CM;US)
SAN JUAN POWER PLANT
See FOSSIL-FUEL POWER PLANTS
SAN ONOFRE-2 REACTOR
Ten-year rollover of San Onofre inservice testing program for pumps and valves to OM-6 and OM-10, 20:5723 (RA;US)
SAN ONOFRE-3 REACTOR
Ten-year rollover of San Onofre inservice testing program for pumps and valves to OM-6 and OM-10, 20:5723 (RA;US)
SANDIA LABORATORIES
A compendium of results from long-range alpha detector soil surface monitoring: June 1992–May 1994, 20:5361 (R;US)
Primary standards laboratory report, 1st half 1994, 20:6431 (R;US)

SANDIA NATIONAL LABORATORIES
See also SANDIA LABORATORIES
In-situ containment and stabilization of buried waste: Annual report FY 1994, 20:5384 (R;US)
Research management at the interfaces, 20:6020 (R;US)
SANDSTONES
Horizontal drilling in shallow reservoirs, 20:5051 (RA;US)
Preliminary results on the characterization of cretaceous and Lower Tertiary low-permeability (tight) gas-bearing rocks in the Wind River Basin, Wyoming, 20:5036 (RA;US)
Slant hole completion test, Cozzette and paludal production testing, 20:5046 (RA;US)
SANITARY LANDFILLS
Control of water infiltration into near surface LLW disposal units. Progress report on field experiments at a humid region site, Beltsville, Maryland: Volume 7, 20:5188 (R;US)
In-situ containment and stabilization of buried waste: Annual report FY 1994, 20:5384 (R;US)
Utilization of ash from municipal solid waste combustion. Final report, Phase I, 20:6132 (R;US)
SAPPHIRE
Dielectric properties measurement system at cryogenic temperatures and microwave frequencies, 20:6218 (R;ES)
SATELLITES
An overview of the Nuclear Electric Propulsion Space Test Program (NEPSTP) satellite, 20:5735 (R;US)
SAVANNAH RIVER PLANT
Environmental Policy
Environmental implementation plan, 20:6009 (R;US)
Environmental Quality
Environmental implementation plan, 20:6009 (R;US)
Fuel Reprocessing Plants
History of 232-F, tritium extraction processing, 20:5108 (R;US)
Mass transfer model for two-layer TBP oxidation reactions: Revision 1, 20:5110 (R;US)
Minutes of Technical Division Steering Committee meeting March, 8, 1955, Savannah River Laboratory, 20:5093 (R;US)
Reference: SR-TP-3625, 20:5410 (R;US)
Scope of work – Evaluation estimate of a U-235 recovery plant, 20:5094 (R;US)
Supernate source term analysis: Revision 1, 20:5466 (R;US)
Historical Aspects
Minutes of Technical Division Steering Committee meeting February 8, 1955, Savannah River Laboratory, 20:5862 (R;US)
Land Pollution
Lettuce seed germination and root elongation toxicity evaluation of the F-Area seepline soils, 20:5380 (R;US)
Personnel Dosimetry
Exposure reductions encouraged by the determination of the effective dose equivalent for non-uniform exposures, 20:6620 (R;US)
Radiation Protection
Exposure reductions encouraged by the determination of the effective dose equivalent for non-uniform exposures, 20:6620 (R;US)
Radioactive Waste Disposal
Experiments for evaluation of corrosion to develop storage criteria for interim dry storage of aluminum-alloy clad spent nuclear fuel, 20:5343 (R;US)
Radioactive Waste Management
Evaluation of sludge screening limit for Tank Farm Low Level Waste, 20:5351 (R;US)
Metallurgical Laboratory Hazardous Waste Management Facility groundwater monitoring report. Fourth quarter 1993 and 1993 summary, 20:5349 (R;US)
Receipt and processing of RBOF/RRF liquid waste in H-Tank Farm, 20:5353 (R;US)
Radioactive Waste Processing
SPEEDUP simulation of liquid waste batch processing. Revision 1, 20:5337 (R;US)
Radioactive Waste Storage
Practical guidelines for small-volume additions of uninhibited water to waste storage tanks, 20:5345 (R;US)
Specialized video systems for use in underground storage tanks, 20:5335 (R;US)
Two items: Transcription of a presentation by Dr. E. L. Albenesius, "SRS burial ground operation from an historical perspective"; video tape entitled "Burial ground operation", 20:5346 (R;US)
Remedial Action
Demonstration and evaluation of the pulsed ultraviolet-irradiation gas-treatment system, Savannah River Site, 20:5383 (R;US)
Reprocessing
Radiolysis gases from nitric acid solutions containing HSA and HAN, 20:5089 (R;US)
Safety Analysis
Nuclear criticality safety analysis summary report: The S-Area Defense Waste Processing Facility sludge-only operation, 20:6333 (R;US)
Special Production Reactors
Rough draft of Technical Data Summary covering preparation of initial Mark IIIA plates by extrusion cladding, 20:5865 (R;US)
Trip report, Battelle Memorial Institute, March 8–9, 1955, 20:5863 (R;US)
Visit report, Allegheny Ludlum Steel Corporation on uranium tubes, 20:5864 (R;US)
Storage Facilities
Practical guidelines for small-volume additions of uninhibited water to waste storage tanks, 20:5345 (R;US)
Receipt and processing of RBOF/RRF liquid waste in H-Tank Farm, 20:5353 (R;US)
Two items: Transcription of a presentation by Dr. E. L. Albenesius, "SRS burial ground operation from an historical perspective"; video tape entitled "Burial ground operation", 20:5346 (R;US)
Waste Management
Characterization of hazardous constituents in HLW supernate and implications for solid LLW generation, 20:5350 (R;US)
Metallurgical Laboratory Hazardous Waste Management Facility groundwater monitoring report. Fourth quarter 1993 and 1993 summary, 20:5349 (R;US)
Water Pollution
Analytical results, database management and quality assurance for analysis of soil and groundwater samples collected by cone penetrometer from the F and H Area seepage basins, 20:5379 (R;US)
Results of the quarterly tritium survey of Fourmile Branch and its seeplines in the F- and H-Areas of SRS: September 1993. Revision 1, 20:5378 (R;US)
Semi-annual sampling of Fourmile Branch and its seeplines in the F and H Areas of SRS: July 1992, 20:5377 (R;US)
Water Quality
Environmental implementation plan: Chapter 7, Groundwater protection, 20:5376 (R;US)
Water Treatment Plants
Receipt and processing of RBOF/RRF liquid waste in H-Tank Farm, 20:5353 (R;US)

Management issues in automated audit analysis, 20:6981 (RA;US)
Survey o methods for secure connection to the internet, 20:7068 (R;JP;In Japanese)

SECURITY VIOLATIONS
Status report on CIAC, 20:6998 (RA;US)
What do people really need to know about computer security incidents?, 20:6997 (RA;US)

SEDIMENT BASINS
See SETTLING PONDS

SEDIMENTARY ROCKS
See also SANDSTONES
Comparison between VSP travel times and sonic integrated times. 2nd Report, 20:6460 (IA;JP;In Japanese)

SEDIMENTS
Mapping of pollutants in sediments of the German Wadden Sea - June, 1989 to June, 1992. Final report January 1993, 20:6551 (R;DE;In German)

SEEDS
See also COFFEE BEANS
Lettuce seed germination and root elongation toxicity evaluation of the F-Area seepline soils, 20:5380 (R;US)

SEISMIC DETECTORS
Development and field example of new type receiving system for seismic prospecting in sallow layer, 20:5604 (IA;JP;In Japanese)

SEISMIC EVENTS
The liquefaction method for assessing paleoseismicity, 20:6640 (R;US)

SEISMIC SOURCES
Development and field example of new type receiving system for seismic prospecting in sallow layer, 20:5604 (IA;JP;In Japanese)
Field experiment of 3D reverse VSP, 20:6461 (IA;JP;In Japanese)
Optimization of dynamite source depth for seismic surveys. Part 3. Relation between the ground characteristics at the vibrating spot and spectrum of seismic wave, 20:5002 (IA;JP;In Japanese)
Optimization of dynamite source depth for seismic surveys. Part 4. Field parameter test for a seismic survey in Teradomari, Niigata, 20:5003 (IA;JP;In Japanese)
Survey of pile penetration with velocity logging, 20:6458 (IA;JP;In Japanese)
Verification of geothermal exploration technology for fiscal 1993. Development of fractural type reservoir exploration / development of exploration by utilizing the micro-earthquake, 20:5623 (I;JP;In Japanese)

SEISMIC SURVEYS
Comparison between VSP travel times and sonic integrated times. 2nd Report, 20:6460 (IA;JP;In Japanese)
Field experiment of 3D reverse VSP, 20:6461 (IA;JP;In Japanese)
Fiscal 1991 verification survey on geothermal exploration technology. Development of a method to explore fracture type reservoirs (development of an exploration method using elastic wave / development of downhole equipment for geothermal exploration), 20:5624 (I;JP;In Japanese)
Optimization of dynamite source depth for seismic surveys. Part 3. Relation between the ground characteristics at the vibrating spot and spectrum of seismic wave, 20:5002 (IA;JP;In Japanese)
Optimization of dynamite source depth for seismic surveys. Part 4. Field parameter test for a seismic survey in Teradomari, Niigata, 20:5003 (IA;JP;In Japanese)

SEISMIC WAVES
Ability of a new seismic source 'SEISMIC SHOTPIPE', 20:5603 (IA;JP;In Japanese)
Characterization of a subsurface fracture reopening by cross-hole triaxial seismic measurement and sonic log, 20:5626 (IA;JP;In Japanese)
Characterization of drilling noise as seismic source for inverse VSP by means of downhole triaxial measurement, 20:5598 (IA;JP;In Japanese)
Optimization of dynamite source depth for seismic surveys. Part 3. Relation between the ground characteristics at the vibrating spot and spectrum of seismic wave, 20:5002 (IA;JP;In Japanese)

SELENIUM
Trace element emissions, 20:5682 (RA;US)
Trace species emissions for IGFC, 20:5684 (RA;US)

SELENIUM 79
Selenium release from iodine filters in the event of brine ingress into a repository, 20:5170 (R;DE;In German)

SELENIUM COMPOUNDS
Rotor phases in compound semiconductors, 20:6240 (R;US)

SELF-POTENTIAL SURVEYS
Fluid flow monitoring by electrical prospecting. Three dimensional inversion of SP data, 20:5609 (IA;JP;In Japanese)

SELOX PROCESS

SEMICONDUCTOR SWITCHES
High gain GaAs Photoconductive Semiconductor Switches (PCSS): Device lifetime, high current testing, optical pulse generators, 20:6659 (R;US)
SENSITIVITY
Sensitivity distribution for current focusing resistivity method, 20:5611 (IA;JP;In Japanese)
SENSITIVITY ANALYSIS
ASENT. Analysis of Sensitivity Experiment Data, 20:7042 (CM;US)
SEPARATION EQUIPMENT
See also EXTRACTION APPARATUSES
Advanced electrolytes and synthesis of advanced catalysts and membrane materials, 20:6085 (RA;US)
SERI
See NATIONAL RENEWABLE ENERGY LABORATORY
SETTLING PONDS
216-B-3 expansion ponds closure plan, 20:5159 (R;US)
SEWAGE
See also SEWAGE SLUDGE
Recommendation for sanitary waste water system replacement, 222-S, 20:5276 (R;US)
SEWAGE SLUDGE
Baseline data compilation on radioactivity levels in drinking water, groundwater, waste water, sewage sludge, residues and wastes, accompanying the 1990 annual report on 'Environmental radioactivity and radiation burden', 20:6578 (I;DE;In German)
Co-firing waste materials in an advanced pressurized fluidized-bed combustor, 20:5665 (RA;US)
Research and development on municipal Wastewater treatment processes using electron beams, 20:5489 (IA;JP;In Japanese)
SHALE OIL
Shale oil from the LLNL pilot retort: Metal ions as markers for water and dust, 20:5087 (RA;US)
Shale oil value enhancement research–separation characterization of shale oil, 20:5084 (RA;US)
SHELLS (CONTAINMENT)
See CONTAINMENT SHELLS
SHIELDING
Benchmark problems for intermediate and high energy accelerator shielding, 20:6390 (R;JP)
SHIPMENT
See TRANSPORT
SHOCK WAVES
Calculations of the FLAX events with comparisons to particle velocity data recorded at low stress, 20:6502 (RA;US)
Use of a simple constitutive model for volcanic rocks of the southwestern Nevada volcanic field for the determination of hugoniots in testing media of the Nevada Test Site, 20:6515 (RA;US)
SHOWER COUNTERS
The KTeV PMT laser monitoring system, 20:6448 (R;US)
SI SEMICONDUCTOR DETECTORS
Double-sided silicon microstrip sensors for the CDF SVX II detector, 20:6446 (R;US)
Low-energy nuclear physics with high-segmentation silicon arrays, 20:6432 (R;US)
Model for cryogenic particle detectors with superconducting phase transition thermometers, 20:6456 (R;DE)
The CDF silicon vertex detector SVX and its upgrades, 20:6447 (R;US)
The D0 Silicon Tracker: A completely redesigned vertex detector, 20:6442 (R;US)
SIALON

SILICON
Accumulation of radiation defects in silicon at high-energy ion implantation, 20:6847 (IA;RU;In Russian)
Changes in electrophysical properties of silicon at multistep ion implantation, 20:6840 (IA;RU;In Russian)
Defect formation in silicon irradiated by high-energy argon ions, 20:6848 (IA;RU;In Russian)
Energy dependence of the intensity of backscattering of fast electrons by highly symmetric crystals, 20:6838 (IA;RU;In Russian)
Fundamental study of aluminizing and chromizing process, 20:6207 (RA;US)
Influence of ion flux density and irradiation time on the long-range interaction effect, 20:6849 (IA;RU;In Russian)
Oxygen position in silicon, 20:6852 (IA;RU;In Russian)
Profiling and light scattering studies of Si surfaces, 20:6243 (R;US)
The effect of size-energy factor on mass transfer at ion implantation of two-layer films, 20:6851 (IA;RU;In Russian)
The influence of defect thermal stability on ion-induced crystallization, 20:6853 (IA;RU;In Russian)
SILICON ALLOYS
In-situ fireside corrosion testing, 20:5677 (RA;US)
SILICON CARBIDES
Chemical Vapor Deposition
Microwave-assisted chemical vapor deposition, 20:6237 (RA;US)
Compressibility
Evaluation of strength properties of developed SiC/C compositionally gradient graphite materials, 20:6247 (R;JP;In Japanese)
Corrosion
Coal-fired high performance power generating system. Quarterly progress report, January 1, 1994–March 31, 1994, 20:5666 (R;US)
Fabrication
Development of oxidation-resistant interface coatings, 20:6234 (RA;US)
Engineering-scale development of the vapor-liquid-solid (VLS) process for the production of silicon carbide fibrils, 20:5675 (RA;US)
Fabrication of fiber-reinforced composites by chemical vapor infiltration, 20:5671 (RA;US)
Flexural Strength
Evaluation of strength properties of developed SiC/C compositionally gradient graphite materials, 20:6247 (R;JP;In Japanese)
Fracture Properties
Development of nondestructive evaluation methods and prediction of effects of flaws on the fracture behavior of structural ceramics, 20:5674 (RA;US)
Joining of SiC ceramics and SiC/SiC composites, 20:6235 (RA;US)
Joining
High performance materials in coal conversion/utilization, 20:6072 (RA;US)

Joining of SiC ceramics and SiC/SiC composites, 20:6235 (RA;US)

Materials Testing
Durability of ceramic filters, 20:4983 (RA;US)
High performance materials in coal conversion/utilization, 20:6072 (RA;US)
Results of patch tests, 20:5663 (RA;US)

Mechanical Properties
Development of oxidation-resistant interface coatings, 20:6234 (RA;US)
Engineering-scale development of the vapor-liquid-solid (VLS) process for the production of silicon carbide fibrils, 20:5675 (RA;US)
Materials support for the development of High Temperature Advanced Furnaces (HITAF) - a comparison of selected mechanical properties for three SiC-based ceramics, 20:5652 (RA;US)

Neutron Diffraction
Internal strain measurement using pulsed neutron diffraction at LANSCE, 20:6250 (R;US)

Nondestructive Testing
Development of nondestructive evaluation methods and prediction of effects of flaws on the fracture behavior of structural ceramics, 20:5674 (RA;US)

Strains
Internal strain measurement using pulsed neutron diffraction at LANSCE, 20:6250 (R;US)

SILICON NITRIDES
Densification of nano-size powders, 20:6236 (RA;US)
Soldering ceramics to metals. Development of solders and soldering methods. Final report, 20:6245 (I;DE;In German)
Transport in chemical vapor deposition reactors: A two-dimensional model including multicomponent and thermal diffusion, and species interdiffusion, 20:6239 (R;US)

SILICON OXIDES
Effect of natural organic materials on cadmium and neptunium sorption, 20:5180 (R;US)

SILICON SEMICONDUCTOR DETECTORS
See SI SEMICONDUCTOR DETECTORS

SILICON SOLAR CELLS
1993 annual final progress report: July 1992 through June 1993, 20:5561 (R;US)
Investigations on the conditions for the crucible-free growth of silicon ribbons for solar cells at high pulling speeds. Final report, 20:5557 (R;DE;In German)

SIMPLEX PROCESS
See COAL GASIFICATION

SIMULATORS
See also REACTOR SIMULATORS
Evaluation of the performance of an annular diffusion denuder, 20:6527 (R;US)
Formation model experiment of tilt-coil directional induction logging, 20:5006 (IA;JP;In Japanese)

SIMULATORS (REACTOR)
See REACTOR SIMULATORS

SINE-GORDON EQUATION
Disorder-induced breakdown of soliton and polaron particles, 20:6676 (R;US)

SITE CHARACTERIZATION
Biological Information Document, Radioactive Liquid Waste Treatment Facility, 20:5177 (R;US)
Environmental site assessment, 20:6943 (R;US)
Experimental investigations of sensor-based surface following performed by a mobile manipulator, 20:6123 (R;US)

SITE REHABILITATION
See REMEDIAL ACTION

SITE SELECTION
Electric utility business and related issues in Japan, 20:6054 (IA;JP;In Japanese)

SITE SURVEYS
See SITE CHARACTERIZATION

SKYRMIONS
See SOLITONS

SL GROUPS
Global aspects of the WZNW reduction to Toda theories, 20:6674 (R;JP)

SLC DETECTORS
See STANFORD LINEAR COLLIDER DETECTOR

SLUDGES
See also SEWAGE SLUDGE
Cold test data for equipment acceptance into 105-KE Basin, 20:5247 (R;US)
Heat exchanger bypass test procedure, 20:5233 (R;US)
High-level waste tank modifications, installation of mobilization equipment/check out, 20:5155 (R;US)
High-volume, high-value usage of flue gas desulfurization (FGD) by-products in underground mines. Phase 1: Laboratory investigations; Quarterly report, April–June 1994, 20:4932 (R;US)
Los Alamos National Laboratory simulated sludge vitrification demonstration, 20:5347 (R;US)
Sludge stabilization at the Plutonium Finishing Plant, Hanford Site, Richland, Washington, 20:5150 (R;US)
Sludge stabilization operability test report, 20:5232 (R;US)
Work plan for integrated sludge packaging demonstration, 20:5123 (R;US)

SLURRIES (FUEL)
See FUEL SLURRIES

SMALL BUSINESSES
General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition, 20:6570 (R;US)
Natural gas recovery, storage, and utilization SBIR Program, 20:6016 (RA;US)
Survey on introducing expert system sin office works at electric power companies, 20:7066 (R;JP;In Japanese)

SMARTOR DEVICE
See TOKAMAK DEVICES

SMECTITE
A novel, integrated treatment system for coal waste waters. Quarterly report, June 2, 1994–September 1, 1994, 20:4942 (R;US)

SMOKY EVENT
See ATMOSPHERIC EXPLOSIONS
NUCLEAR EXPLOSIONS

SOCIAL IMPACT
Investigation on influences of large-scale power service interruption n life and economy in the Tokyo metropolitan region, 20:6087 (I;JP;In Japanese)

SOCIO-ECONOMIC ASPECTS
See SOCIO-ECONOMIC FACTORS

SOCIO-ECONOMIC FACTORS
Analysis of regional economic differential in Japan, 20:5982 (R;JP;In Japanese)

SODIUM
Interim storage of sodium in ferritic steel tanks at ambient temperature, 20:5872 (R;US)

SODIUM ALLOYS
Rotor phases in compound semiconductors, 20:6240 (R;US)

SODIUM CHLORIDES
A novel geotechnical/geostatistical approach for exploration and production of natural gas from multiple geologic strata. Technical progress report, July–September 1994, 20:5030 (R;US)
Localized corrosion and stress corrosion cracking characteristics of low-aluminum-content iron-aluminum alloys, 20:6205 (RA;US)

SODIUM HYDRIDES
Next generation coal utilization research and development. Advanced coal cleaning technology, 20:4905 (R;JP;In Japanese)

SODIUM-WATER REACTIONS
See MOLTEN METAL-WATER REACTIONS

SOFC
See SOLID ELECTROLYTE FUEL CELLS

SOFT SOLDERING
See SOLDERING

SOILS
Chemical Analysis
Analytical results, database management and quality assurance for analysis of soil and groundwater samples collected by cone penetrometer from the F and H Area seepage basins, 20:5379 (R;US)
Contamination
Lettuce seed germination and root elongation toxicity evaluation of the F-Area seepline soils, 20:5380 (R;US)
Summary report of a workshop on phytoremediation research needs, 20:6547 (R;US)
Decontamination
Decontamination Systems Information and Research Program: Quarterly report, July–September 1994, 20:6548 (R;US)
Degradation of mix hydrocarbons by immobilized cells of mix culture using a trickle fluidized bed reactor. Final report: June 1992–June 1994, 20:6549 (R;US)
Innovative technologies for in-situ remediation, 20:6571 (R;US)
Physicochemical and mineralogical characterization of uranium-contaminated soils from the Fernald Integrated Demonstration Site, 20:5385 (R;US)
Uranium soils integrated demonstration: Soil characterization project report, 20:5417 (R;US)
Degassing
Demonstration and evaluation of the pulsed ultraviolet-irradiation gas-treatment system, Savannah River Site, 20:5383 (R;US)
Grouting
In-situ containment and stabilization of buried waste: Annual report FY 1994, 20:5384 (R;US)
Laser Spectroscopy
RCRA materials analysis by laser-induced breakdown spectroscopy: Detection limits in soils, 20:6273 (R;US)
Radiant Heat Transfer
Thermal radiant exitance model performance: Soils and forests, 20:5552 (R;US)
Radionuclide Migration
Hazardous constituent source term. Revision 2, 20:5135 (R;US)
RESRAD5.43. Site-Specific Residual Radioactivity, 20:7016 (CM;US)
Radionuclide logging of Tank 216-T-106, borehole 299-W10-196, 20:5372 (R;US)
Remedial Action
Dynamic Underground Stripping: In situ steam sweeping and electrical heating to remediate a deep hydrocarbon spill, 20:5434 (R;US)
Projects at the Component Development and Integration Facility. Quarterly technical progress report, July 1–September 30, 1994, 20:6074 (R;US)
Summary report of a workshop on phytoremediation research needs, 20:6547 (R;US)
Surface Energy
Thermal radiant exitance model performance: Soils and forests, 20:5552 (R;US)
Washing
Laboratory procedures for waste form testing, 20:5443 (R;US)

SOLAR ABSORBERS
Production and characterization of optical components for active and passive solar thermal applications. Final report, 20:5581 (R;DE;In German)

SOLAR ARCHITECTURE
SOLAR5. Passive Energy Building Design Tool, 20:7043 (CM;US)
Sunspace basics, 20:5575 (R;US)

SOLAR CENTRAL RECEIVERS
See CENTRAL RECEIVERS

SOLAR COLLECTORS
See also FLAT PLATE COLLECTORS
Development of solar collectors mounted on roofs of steel, 20:5591 (R;DK;In Danish, Swedish)
Extension of the actively solar heated single-family house at the Luebeck Polytechnic since 1982 for demonstration purposes by passive components and simultaneous increase of living comfort. Final report, 20:6098 (R;DE;In German)

SOLAR CONCENTRATORS
Co-validation of three methods for optical characterization of point-focus concentrators, 20:5571 (R;US)
Mirror alignment and focus of point-focus solar concentrators, 20:5592 (R;US)

SOLAR COOLING SYSTEMS
Colorado State University program for developing, testing, evaluating and optimizing solar heating and cooling systems: Project status report for the months of October and November, 1994, 20:5576 (R;US)

SOLAR ENERGY CONVERSION
See also SOLAR THERMAL CONVERSION
Chemical reactions in a solar furnace. 2. Direct heating of a vertical reactor in an insulated receiver. Experiments and computer simulations, 20:5583 (RA;IL)
Methanation of CO/H_2 and of reformer products, 20:5584 (RA;IL)

SOLAR ENERGY RESEARCH INSTITUTE

VOCATIONAL TRAINING
See TRAINING

VOLATILE MATTER
Final report on proposal to develop and test a membrane sampling module for the extraction of volatile organic compounds from water, 20:6272 (R;US)
Hazardous constituent source term. Revision 2, 20:5135 (R;US)
Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring. Quarterly report, January 1, 1994–March 31, 1994, 20:5409 (R;US)

VOLCANIC REGIONS
Fracture characterization in volcanic regions. Technology developments on pressure transient analysis, 20:5602 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 1. Data acquisition system and data processing system, 20:5618 (IA;JP;In Japanese)
Magnetotelluric sounding at Bandai volcano. Part 2. Resistivity structure beneath the Bandai volcano, 20:5619 (IA;JP;In Japanese)

VOLTAGE
See ELECTRIC POTENTIAL

VOLTAGE REGULATORS
Investigation of arc length versus flange thickness while using an arc voltage controller, 20:6183 (R;US)

VOLTAIC CELLS
See ELECTRIC BATTERIES

VORTICES (MAGNETIC)
See MAGNETIC FLUX

VRAIN REACTOR
FSV experience in support of the GT-MHR reactor physics, fuel performance, and graphite, 20:5729 (R;US)

W

W MINUS BOSONS
A measurement of the mass of the W vector boson at CDF, 20:6753 (R;US)
Studies of strong electroweak symmetry breaking at future e^+e^- linear colliders, 20:6708 (R;US)
W mass measurements from D∅ and CDF experiments at TeVatron, 20:6752 (R;US)

W PLUS BOSONS
A measurement of the mass of the W vector boson at CDF, 20:6753 (R;US)
Studies of strong electroweak symmetry breaking at future e^+e^- linear colliders, 20:6708 (R;US)
W mass measurements from D∅ and CDF experiments at TeVatron, 20:6752 (R;US)

W STELLARATORS
See STELLARATORS

WAGON WHEEL EVENT
See NUCLEAR EXPLOSIONS

WAKEFIELD ACCELERATORS
Envelope evolution of a laser pulse in an active medium, 20:6368 (R;US)

WASHINGTON
Analysis of deep seismic reflection and other data from the southern Washington Cascades, 20:5040 (RA;US)

WASTE BURIAL
See UNDERGROUND DISPOSAL

WASTE DISPOSAL
See also RADIOACTIVE WASTE DISPOSAL
SANITARY LANDFILLS
UNDERGROUND DISPOSAL
FGD waste disposal cost and sensitivity analysis, 20:4926 (RA;US)
The Louisiana State University waste-to-energy incinerator, 20:6126 (R;US)

WASTE FORMS
Comparison of glassy slag waste forms produced in laboratory crucibles and in a bench-scale plasma furnace, 20:5130 (R;US)
Laboratory procedures for waste form testing, 20:5443 (R;US)
Non-destructive examination of grouted waste, 20:5322 (R;US)
Work plan for waste receiving and processing module 2A waste characterization study, 20:5264 (R;US)

WASTE ISOLATION PILOT PLANT
See WIPP

WASTE MANAGEMENT
See also NONRADIOACTIVE WASTE MANAGEMENT
RADIOACTIVE WASTE MANAGEMENT
WASTE DISPOSAL
WASTE PROCESSING
WASTE RETRIEVAL
WASTE TRANSPORTATION
305 Building Cold Test Facility Management Plan, 20:5751 (R;US)

Conceptual design report, Hazardous Materials Management and Emergency Response (HAMMER) Training Center, 20:5447 (R;US)
Environmental Restoration Program waste minimization and pollution prevention self-assessment, 20:5412 (R;US)
Guidance for establishment and implementation of a national sample management program in support of EM environmental sampling and analysis activities, 20:5403 (R;US)
Guidance for establishment and implementation of field sample management programs in support of EM environmental sampling and analysis activities, 20:5402 (R;US)
Project T100 – Hazardous Materials Management and Emergency Response Training Center (HAMMER), 20:5449 (R;US)
Project plan, Hazardous Materials Management and Emergency Response Training Center: Project 95L-EWT-100, 20:5448 (R;US)

WASTE OILS
Research on feasibility of utilization of spent vegetable oils as substitutes for petroleum derived oils, 20:6118 (R;JP;In Japanese)

WASTE PROCESSING
See also ANAEROBIC DIGESTION
RADIOACTIVE WASTE PROCESSING
Case study on the destruction of organic dyes in supercritical water, 20:6569 (R;US)
Description of the grout system dynamic simulation, 20:5223 (R;US)

WASTE PROCESSING PLANTS
Actinide Source Term Program, position paper. Revision 1, 20:5134 (R;US)
Development of an expert system for process control of bioreactors in a sewage system. Final report, 20:5535 (R;DE;In German)
Tunable diode lasers as continuous emission monitors for thermal waste treatment processes, 20:6543 (R;US)

WASTE PRODUCT UTILIZATION
Energy implications of integrated solid waste management systems. Final report, 20:6122 (R;US)
Flue gas desulfurization gypsum and fly ash, 20:4955 (R;US)

WASTE RETRIEVAL
Preliminary safety evaluation for 241-C-106 waste retrieval, project W-320, 20:5309 (R;US)
Solid waste retrieval. Phase 1, Operational basis, 20:5450 (R;US)

WASTE SOLUTIONS
See LIQUID WASTES

WASTE TRANSPORTATION
Radioactive Liquid Waste Treatment Facility: Environmental Information Document, 20:5176 (R;US)
Transportation impact analysis for the shipment of Low Specific Activity Nitric Acid, 20:5125 (R;US)

WASTE TREATMENT
See WASTE PROCESSING

WASTE WATER
300 Area TEDF NPDES Permit Compliance Monitoring Plan, 20:5242 (R;US)
300 Area treated effluent disposal facility sampling schedule, 20:5373 (R;US)
A novel, integrated treatment system for coal waste waters. Quarterly report, June 2, 1994–September 1, 1994, 20:4942 (R;US)
Baseline data compilation on radioactivity levels in drinking water, groundwater, waste water, sewage sludge, residues and wastes, accompanying the 1990 annual report on 'Environmental radioactivity and radiation burden', 20:6578 (I;DE;In German)
Filtration and flocculating filtration, 20:6579 (R;DE)
General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition, 20:6570 (R;US)

WASTEFORMS

Shale oil from the LLNL pilot retort: Metal ions as markers for water and dust, 20:5087 (RA;US)

WATER COOLANT
See WATER

WATER COOLED REACTORS
See also BWR TYPE REACTORS
JMTR REACTOR
OSIRIS REACTOR
PWR TYPE REACTORS
TRIGA TYPE REACTORS
Advanced reactor pump and valve issues, 20:5807 (RA;US)
Evaluation of the RELAP5/MOD3 multidimensional component model, 20:5963 (R;US)
Heavy-Section Steel Irradiation Program. Volume 2, No. 1: Semiannual progress report, October 1990–March 1991, 20:5952 (R;US)
MELCOR 1.8.2 assessment: Aerosol experiments ABCOVE AB5, AB6, AB7, and LACE LA2, 20:5962 (R;US)
Probabilistic-based evaluation of design rules for components affected by intersystem LOCAs, 20:5709 (RA;US)
Progress on risk-based inspection guidelines: Application of Surry-1 pilot study to improved inservice inspection plans, 20:5703 (RA;US)
RELAP5/MOD3 code coupling model, 20:5698 (RA;US)

WATER INFLUX
Control of water infiltration into near surface LLW disposal units. Progress report on field experiments at a humid region site, Beltsville, Maryland: Volume 7, 20:5188 (R;US)
Engineering evaluation of intrusion prevention strategies for single-shell tanks, 20:5295 (R;US)

WATER MODERATOR
See WATER

WATER POLLUTION
Chickamauga reservoir embayment study - 1990, 20:5551 (R;US)

WATER POLLUTION CONTROL
Study of thermophilic anaerobic cleaning systems, 20:6581 (R;SE;In Swedish)

WATER PUMPS
Applying risk-based methods to inservice testing, 20:5793 (RA;US)
Detection and effects of pump low-flow operation, 20:5704 (RA;US)
Model testing on inlet chambers of cooling water pumps, 20:5785 (RA;US)
Ranking of risk significant components for the Davis-Besse Component Cooling Water System, 20:5792 (RA;US)

WATER QUALITY
Logging system for water quality monitoring in deeper depth, 20:5605 (IA;JP;In Japanese)

WATER RESERVOIRS
Chickamauga reservoir embayment study - 1990, 20:5551 (R;US)
Convective circulation during differential heating and cooling in the Minky Creek embayment of Guntersville Reservoir, data summary for 1991, 20:5550 (R;US)

WATER RESOURCES
Environmental implementation plan: Chapter 7, Groundwater protection, 20:5376 (R;US)

WATER SOLUTIONS
See AQUEOUS SOLUTIONS

WATER TREATMENT
Development of water purification technologies for intensive fish culture. 10. Rearing of Japanese flounder with closed seawater recirculation system equipped with immobilized bacteria, 20:6575 (R;JP;In Japanese)

WATER TREATMENT PLANTS
300 Area TEDF DOE order compliance applicability assessment, 20:5243 (R;US)
300 Area Treated Effluent Disposal Facility computer software release cover sheet and revision record, 20:5241 (R;US)
Functional design criteria for Project W-252, Phase II Liquid Effluent Treatment and Disposal: Revision 1, 20:5274 (R;US)
Project W-049H collection system Acceptance Test Procedure, 20:5257 (R;US)
Project W-049H instrument and control Acceptance Test Procedure, 20:5258 (R;US)
Readiness plan, Hanford 300 Area Treated Effluent Disposal Facility: Revision 1, 20:5244 (R;US)
Receipt and processing of RBOF/RRF liquid waste in H-Tank Farm, 20:5353 (R;US)

WATER VAPOR
Development, implementation and assessment of specific closure laws for inverted-annular film-boiling in a two-fluid model, 20:6341 (R;CH)
Low-quality natural gas sulfur removal/recovery with membranes, 20:5056 (RA;US)
Upgrading natural gas by means of highly performing polyimide membranes, 20:5055 (RA;US)

WATERBORNE PARTICLES
See PARTICULATES

WATERSHEDS
See also PICEANCE CREEK BASIN
Aerial inventory of land uses and nonpoint pollution sources in the Lick Creek Watershed of the Nolichuky River Basin, 20:6580 (R;US)
Hydrologic data summary for the White Oak Creek watershed at Oak Ridge National Laboratory, Oak Ridge, Tennessee (January–December 1993), 20:5423 (R;US)

WATT-HOUR METERS
See POWER METERS

WAVE PROPAGATION
Numerical resolution of the time-domain three-dimensional Maxwell equations by a conform finite element approximation. Part II: numerical results, 20:6644 (R;FR;In French)
Study on propagation impairments, distortions and unavailability on digital microwave links, 20:6359 (R;JP;In Japanese)

WAVEGUIDES
Numerical resolution of the time-domain three-dimensional Maxwell equations by a conform finite element approximation. Part II: numerical results, 20:6644 (R;FR;In French)

WAVES (SHOCK)
See SHOCK WAVES

WAZ 16
See NICKEL BASE ALLOYS

WEAK CHARGED CURRENTS
Determination of the structure of τdecays in the reaction $e^+e^- \rightarrow \tau^+\tau^- \rightarrow \rho^+$ anti $\nu_\tau\rho^-\nu_\tau$ and a precision measurement of the τ-neutrino helicity, 20:6714 (R;DE)

WEAPONS
See also BIOLOGICAL WARFARE AGENTS
CHEMICAL WARFARE AGENTS
NUCLEAR WEAPONS
Noise and vibration investigations of the Sandia National Laboratories Sol se Mete Aerial Cable Facility, 20:6632 (R;US)
Piezoelectric motor development at AlliedSignal Inc., Kansas City Division, 20:6361 (R;US)

WECS
See WIND TURBINES

WEIGHING
See WEIGHT MEASUREMENT

WEIGHT INDICATORS
Weight/balance portable test equipment, 20:5250 (R;US)

WEIGHT MEASUREMENT
Weight/balance portable test equipment, 20:5251 (R;US)

WEINBERG-SALAM GAUGE MODEL
Studies of strong electroweak symmetry breaking at future e^+e^- linear colliders, 20:6708 (R;US)

WELDED JOINTS
Characterization of Type 304L stainless steel solid-state closure welds for radioactive waste containment, 20:5334 (R;US)
Heavy-Section Steel Irradiation Program. Volume 2, No. 1: Semiannual progress report, October 1990–March 1991, 20:5952 (R;US)
Heavy-section steel irradiation program progress - recent results from Midland low upper-shelf weld studies, 20:5722 (RA;US)
Method for cutting steam heat losses during cyclic steam injection of wells. Third quarterly report, 20:5011 (R;US)

WELDING MACHINES
Investigation of arc length versus flange thickness while using an arc voltage controller, 20:6183 (R;US)

WELDS
See WELDED JOINTS

WELL CASINGS
Method for cutting steam heat losses during cyclic steam injection of wells. Third quarterly report, 20:5011 (R;US)

WELL DRILLING
Groundwater quality monitoring well installation for Lower Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program, 20:6562 (R;US)
Groundwater quality monitoring well installation for Waste Area Grouping at Oak Ridge National Laboratory, Oak Ridge, Tennessee. Environmental Restoration Program, 20:6563 (R;US)

WELL LOGGING
See also SONIC LOGGING
TEMPERATURE LOGGING
Development of vertical electromagnetic profiling (VEMP) method. Conceptual design and simulation results, 20:5622 (IA;JP;In Japanese)
Formation model experiment of tilt-coil directional induction logging, 20:5006 (IA;JP;In Japanese)
Temperature profile/bottom pressure monitoring system utilizing optical fiber and capillary tube. Field test in a geothermal well, 20:5608 (IA;JP;In Japanese)
Ultrasonic borehole televiewer applicability to soft rock deep well, 20:5599 (IA;JP;In Japanese)

WELL LOGGING EQUIPMENT
Logging system for water quality monitoring in deeper depth, 20:5605 (IA;JP;In Japanese)

WELL PRESSURE
Temperature profile/bottom pressure monitoring system utilizing optical fiber and capillary tube. Field test in a geothermal well, 20:5608 (IA;JP;In Japanese)

WELL STIMULATION
Dynamic reservoir imaging by electrical method in steam stimulation process. Results observed in the field, 20:5082 (IA;JP;In Japanese)
Introduction to the GRI/DOE Field Fracturing Multi-site Project, 20:5045 (RA;US)

WELL TEMPERATURE
Temperature profile/bottom pressure monitoring system utilizing optical fiber and capillary tube. Field test in a geothermal well, 20:5608 (IA;JP;In Japanese)

WEST GERMANY
See FEDERAL REPUBLIC OF GERMANY

WEST VIRGINIA
A novel geotechnical/geostatistical approach for exploration and production of natural gas from multiple geologic strata. Technical progress report, July–September 1994, 20:5030 (R;US)
Multistrata exploration and production study, 20:5043 (R;US)

WESTERN REGION
See USA

WETLANDS
General design, construction, and operation guidelines: Constructed wetlands wastewater treatment systems for small users including individual residences. Second edition, 20:6570 (R;US)

Pipeline corridors through wetlands - impacts on plant communities: Bayou Grand Cane, De Soto Parish, Louisiana. Topical report, August 1991–July 1993, 20:6552 (R;US)
Pipeline corridors through wetlands - impacts on plant communities: Bayou Pointe Aux Chenes, Terrebonne Parish, Louisiana. Topical report, August 1991–April 1994, 20:6553 (R;US)
Wetlands Assessment for site characterization, Advanced Neutron Source (ANS), 20:5364 (R;US)

WHEY
Alcohol production by continuous cofermentation of whey and corn, 20:5525 (RA;US)

WILD ANIMALS
Radioactive cesium in boreal forest ecosystems, 20:6561 (R;SE;In Swedish)

WILPUTTE PROCESS
See COAL GASIFICATION

WIND ENERGY CONVERSION SYSTEMS
See WIND TURBINES

WIND GENERATORS
See ELECTRIC GENERATORS
WIND TURBINES

WIND POWER PLANTS
Technical innovations and development perspectives of renewable energy sources. 9. Technical report on the research project: Analysis of possibilities of solar power supply and its development in Nordrhein-Westfalen, 20:6071 (R;DE;In German)
Wind park of the Hannover-Braunschweigische Stromversorgungs-Aktiengesellschaft (HASTRA), 20:5631 (IA;DE;In German)
Wind power plants in North-Rhine Westphalia: Wind power generation in the dyked land of Northwestern Germany. Report on results, 20:5636 (R;DE;In German)

WIND TUNNELS
NTS-spill test facility wind tunnel exhaust plume characterization, 20:6471 (R;US)

WIND TURBINES
See also HORIZONTAL AXIS TURBINES

Agriculture
Is the utilization of wind power interesting for farmers?, 20:5642 (IA;DE;In German)

Computerized Control Systems
Adaptive pitch control of wind turbine, 20:5644 (R;DK)
Modelling and control of a wind turbine, 20:5643 (R;DK)

Design
"Wind power station Dillenberg" near Sulingen. Three years of wind power without environmental impact, 20:5641 (IA;DE;In German)
Development of a 19 m wing with improved capacity and structure. Final report, 20:5645 (I;DK;In Danish)
The wind energy plant "Kronsberg" of Stadtwerke Hannover AG, 20:5632 (IA;DE;In German)

Dynamic Loads
Blade angle adjustment on wind turbines with individual flapping hinges. Final report, 20:5635 (R;DE;In German)

Economics
Is the utilization of wind power interesting for farmers?, 20:5642 (IA;DE;In German)

Forecasting
The wind energy potential in Greater Hannover, 20:5639 (IA;DE;In German)
Utilization of wind energy in Greater Hannover - an introduction, 20:5638 (IA;DE;In German)

Gears
Gear boxes in wind turbines. Principles for calculation of fatigue under changing loads, 20:5634 (R;DK;In Danish)

Inclination
Adaptive pitch control of wind turbine, 20:5644 (R;DK)

Mathematical Models
Modelling and control of a wind turbine, 20:5643 (R;DK)

Operation
"Wind power station Dillenberg" near Sulingen. Three years of wind power without environmental impact, 20:5641 (IA;DE;In German)

Performance
The wind energy plant "Kronsberg" of Stadtwerke Hannover AG, 20:5632 (IA;DE;In German)

Rotors
Blade angle adjustment on wind turbines with individual flapping hinges. Final report, 20:5635 (R;DE;In German)

Site Selection
The wind energy potential in Greater Hannover, 20:5639 (IA;DE;In German)
Utilization of wind energy in Greater Hannover - an introduction, 20:5638 (IA;DE;In German)
Utilization of wind energy in greater Hanover, 20:5637 (I;DE;In German)
Wind conditions on selected sites of Greater Hannover, 20:5640 (IA;DE;In German)

Turbine Blades
Development of a 19 m wing with improved capacity and structure. Final report, 20:5645 (I;DK;In Danish)

Wind Power
Wind conditions on selected sites of Greater Hannover, 20:5640 (IA;DE;In German)

WINDOWS
Advances in glazing materials for windows, 20:6093 (R;US)

WIPP
Actinide Source Term Program, position paper. Revision 1, 20:5134 (R;US)
Intermediate scale borehole (Room C): In situ data report (January 1989–June 1993), 20:5208 (R;US)
Position paper on gas generation in the Waste Isolation Pilot Plant, 20:5133 (R;US)
Scenario development for the Waste Isolation Pilot Plant: Building confidence in the assessment, 20:5211 (R;US)

WOLFRAM
See TUNGSTEN

WOOD
Develop apparatus and process for second-stage drying. Quarterly progress report, September 26–December 26, 1994, 20:6112 (R;US)
Greenhouse impacts of the use of peat and wood for energy, 20:4956 (R;FI)

WOOD ALCOHOL
See METHANOL

WOOD STOVES
See STOVES

WOOD-FUEL POWER PLANTS
External noise when using biofuel, 20:5539 (R;SE;In Swedish)

WORKERS

WYOMING
Enhanced oil recovery utilizing high-angle wells in the Frontier Formation, Badger Basin Field, Park County, Wyoming. Final report for the period October 1992–October 1993, 20:5009 (R;US)

X

X RADIATION
Comparison of characteristics of coherent radiations from crystals and periodic radiators, 20:6801 (IA;RU;In Russian)

X-RASERS
See X-RAY LASERS

X-RAY DETECTION
Properties of melt-grown ZnSe solid-state radiation detectors, 20:6433 (R;US)

X-RAY EQUIPMENT
A new X-ray inspection of fuel plates, 20:5815 (RA;US)

X-RAY FLUORESCENCE ANALYSIS
Multivariate calibration and quantitation using artificial neutral networks, 20:6270 (IA;PL)

X-RAY LASERS
Na-like autoionizing levels: Plasma diagnostics and prospects for photopumped soft x-ray lasers, 20:6817 (R;US)

X-RAY RADIOGRAPHY
Algorithm for dual-energy radiographic analysis, 20:6351 (R;US)
XANTHUM GUM
Rheological properties essential for the atomization of coal water slurries (CWS). Quarterly progress report, June 15, 1994–September 1994, 20:4985 (R;US)
XI NEUTRAL
See XI NEUTRAL PARTICLES
XI NEUTRAL PARTICLES
Photoproduction of a hypothetic neutral particle in oriented monocrystal, 20:6757 (IA;RU;In Russian)
XI-NEUTRAL
See XI NEUTRAL PARTICLES

Y

Y-12 PLANT
An Assessment of health risk associated with mercury in soil and sediment from East Fork Poplar Creek, Oak Ridge, Tennessee. Final report, 20:5359 (R;US)
Environmental Restoration Program waste minimization and pollution prevention self-assessment, 20:5412 (R;US)
Remedial investigation report on Bear Creek Valley Operable Unit 2 (Rust Spoil Area, Spoil Area 1, and SY-200 Yard) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee. Volume 1, Main text, 20:5157 (R;US)
YANKEE EVENT
See ATMOSPHERIC EXPLOSIONS
NUCLEAR EXPLOSIONS
YEASTS
Bacteria for power alcohol yeast for bread and beer, 20:5524 (RA;US)
YIELD (BIOLOGICAL)
See PRODUCTIVITY
YTTERBIUM COMPOUNDS
Advanced electrolytes and synthesis of advanced catalysts and membrane materials, 20:6085 (RA;US)
YTTRIUM ALUMINIUM GARNETS
See ALUMINIUM OXIDES
FERRITE GARNETS
YTTRIUM OXIDES
Ion-assisted laser deposition of intermediate layers for $YBa_2Cu_3O_{7-\delta}$ thin film growth on polycrystalline and amorphous substrates, 20:6231 (R;US)
Preparation of high quality $YBa_2Cu_3O_{7-\delta}$ thick films on flexible Ni-based alloy substrates with textured buffer layers, 20:6225 (R;US)
YUCCA MOUNTAIN
Bulk and mechanical properties of the Paintbrush tuff recovered from borehole USW NRG-6: Data report, 20:5368 (R;US)
Development of models for fast fluid pathways through unsaturated heterogeneous porous media, 20:5210 (R;US)
Effect of natural organic materials on cadmium and neptunium sorption, 20:5180 (R;US)
Evidence of prehistoric flooding and the potential for future extreme flooding at Coyote Wash, Yucca Mountain, Nye County, Nevada, 20:5217 (R;US)
Geochemical investigations related to the Yucca Mountain environment and potential nuclear waste repository, 20:5189 (R;US)
Gravity and magnetic data of Midway Valley, southwest Nevada, 20:5218 (R;US)
Gravity and magnetic study of Yucca Wash, southwest Nevada, 20:5219 (R;US)
Great Basin Paleoenvironmental Studies Project: Technical progress report, Second quarter (Year 2), September–December 1994, 20:5156 (R;US)
Hydraulic conductivity of rock fractures, 20:5187 (R;US)
Preparation for kinetic measurements on the silicates of the Yucca Mountain potential repository. [Final report], June 15, 1993–September 30, 1993, 20:5173 (R;US)
Yucca Mountain Site Characterization Project bibliography, January–June 1993. An update, 20:5158 (R;US)

Z

Z NEUTRAL BOSONS
A study of K_s Λ and $\bar{\Lambda}$ production in hadronic Z^0 decays, 20:6748 (R;US)
Inclusive photoproduction of hadrons at HERA. - Direct photon production at LEP and HERA, 20:6719 (R;DE)
Next-to-leading order fragmentation functions for pions and kaons, 20:6715 (R;DE)
SMATASY. A Program for the model independent description of the Z resonance, 20:6716 (R;DE)

Report Number Index

The report number index consists of the alphanumeric identifiers assigned to report literature as well as patent and conference literature cited in this publication. Entries provide the abstract number; the source(s) of availability of the document; the GPO file prefix for GPO depository library documents; the order number for OSTI and NTIS report ordering purposes; and, if the document was distributed under the DOE distribution program, the category number is shown for paper copy (PC), microfiche (MF), or no distribution (ND). These categories are included to assist DOE librarians in responding to requests for reports in their collections. The index also lists secondary numbers, with the corresponding abstract numbers and cross-references to other identifying numbers.

ORDER FORM

DOE and DOE Contractors: Fill in Parts I, II, and IV. **Others:** Fill in Parts I, III, and IV. Mark appropriate blanks in Part IV to indicate quantity and form (microfiche or paper copy).

I. SHIPPING AND PAYMENT INFORMATION

Ordering Address

Name _____ Telephone _____

Address _____

City _____ State _____ Zip _____

Shipping Address (if different from above)

Name _____

Address _____

City _____ State _____ Zip _____

_____

SIGNATURE (Required to validate ALL orders)

II. OSTI ORDERS (DOE and DOE contractors can order from OSTI.)

☐ Charge OSTI deposit account no. _____

☐ Charge to my ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

Mail orders to: U.S. Department of Energy
Office of Scientific and Technical Information
P.O. Box 62
Oak Ridge, TN 37831

III. NTIS ORDERS

☐ Charge NTIS deposit account no. _____

☐ Check/Money Order enclosed for $ _____

☐ Charge to my ☐ American Express ☐ VISA ☐ Mastercard

_____ _____

Account Number **Card expiration date**

☐ Ship and Bill (see below for restrictions) _ _ _ _ _ _ _ _ _

Employer identification number (9 digits) —

Purchase Order number _____

Phone number of billing office _____
(Required for Ship & Bill orders)

Ship & Bill service is restricted to North American business locations for an extra $7.50 per order (or per Custom Search). The business' employer identification number plus the phone number of the office paying the bill are required to process these requests. A late payment charge will be applied to billings more than 30 days overdue. Prepaying, using an NTIS Deposit Account or a charge account, speeds order processing. Be sure payment and order are sent together. Checks, payable to NTIS, must be in U.S. dollars.

Mail orders to: U.S. Department of Commerce
Technology Administration
National Technical Information Service
Springfield, VA 22161

IF NO METHOD OF PAYMENT IS INDICATED, YOUR ORDER WILL BE RETURNED TO YOU AS A PRICE QUOTE UNPROCESSED.

IV. SELECTIONS

_____ _____

Federal Depository Library Program

As a result of an agreement between the U.S. Government Printing Office (GPO) and the Department of Energy, beginning in 1984 DOE reports with unlimited distribution are now included in the Federal Depository Library Program. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and interlibrary loans; however, they are not sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself. Do not send checks or orders to these libraries.
